"THE DANIEL BEST" 50 Horse Power TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, **50 HORSE POWER.**

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

### THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 3/4" wide by 1 1/2" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : S. K. SNODGRASS, Denver, Colo. (The Windsor.)

# UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

## DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes  
or Underground Work,  
USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

# CATES IRON WORKS

## MINING MACHINERY.

Among Our Great Specialties Are:

### HOISTS.

This is a type of a very strong, well-designed machine, single or double drum.

### BRUCKNER ROASTERS.

In this line we have equipped some of the most important plants. We furnish all the accessories of a complete installation.

### IRON JIGS.

We take special pride in directing attention to a first-class jig shown in this cut.

### SMELTING FURNACES.

Our furnace line includes Lead, Copper, Round, Rectangular, Reverberatory, Cupelling, Wrought Iron, Cast Iron, and all accessories.

### CONVERTERS.

This specialty is strictly up-to-date, with every possible feature of a perfect plant. We have introduced some very important features in copper converter installations.

### TILTING CRADLES.

This small cut will give an idea of the construction of this machine. All the cuts in this ad. made direct from the originals on our shop floors.

PORTLAND OREGON

# THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

**MAIN BELTING COMPANY,**  
1225-41 Carpenter Street, Philadelphia.  
55-57 Market St., Chicago. 130 Pearl St., Boston.

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD Laver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

### The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed

## Have You Noisy Gearing?

If so, we can appreciate your trouble, and we can also help you out. We have just what you are looking for—a Noiseless Gear.

New Process Raw Hide Gears not only do away with the noise; they also reduce vibration and prolong the life of the metal wheels with which they mesh. Another feature of importance in many instances is that they are cleanly, no lubricant being needed.

We make Spurs, Bevels and Frictions. Have made Spurs as large as 36" and Bevels up to 35".

Send specifications of what you want and we will quote you best prices.

## DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or  
ree-milling ore by compressed air. The operation  
is purely mechanical. No chemicals, no quick-  
silver; no black sand remains with the gold. Will  
work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 30 to 30 cu. yds. of gravel per  
day. Will save fine and coarse gold and nuggets  
of any size, comparatively free from black sand.  
Will do better work under favorable circumstances  
than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

# THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

**DETROIT LUBRICATOR CO., DETROIT, MICH.**

141-143 First St., San Francisco, Cal.

## POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.  
Send us your inquiries.

# THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact.

RAWHIDE GOLD MINING COMPANY,

JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

Yours truly, W. A. NEVILLS, President.

MR. J. S. BROWNELL—DEAR SIR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best.

Yours very truly,

THE CONS. SOUTH SPRING HILL G. M. CO.

By JOHN R. TREGLOAN, Superintendent.

# THE "JAMES" AUTOMATIC ORE FEEDER.

## THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.

" " " iron " - 1000 "

## ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

## Manufacture of Linseed Oil.

Linseed oil, made from flaxseed, is the liquid part of ordinary oil paints. It is sometimes obtained by treating the seed with naphtha, thus dissolving out the oil, which is separated by distilling off the solvent for use again. Comparatively little oil is made in this way, most of it being made by extraction under pressure. The seed is coarsely ground, then heated, sometimes by running a jet of live steam into the meal, sometimes by putting the meal into a steam-heated vessel. It is then, by a machine, put into bags and pressed enough to make it take a suitable form, after which these bags are put into a powerful press and the oil is squeezed out. Moisture and other matters are mixed with the oil, and these are separated by allowing it to settle; it is at last filtered. This process of purification takes from one to three months; but even after this the oil improves for a long time by standing, during which some foreign matters separate and settle out.

Linseed oil possesses in a higher degree than any other oil the property of thickening rapidly on exposure to the air. This is not due to evaporation, but the contrary; it absorbs and combines with oxygen from the air, and thus increases in weight, though it decreases in bulk. A paint made with raw linseed oil alone will dry so that it may be handled in five or six days; but, as this is a long time, it is thought necessary to treat the oil so that it may dry more quickly—that is, may absorb oxygen more rapidly. Oil so treated is called "boiled oil." It used to be made by heating the oil over a direct fire in a kettle, and with this oil is mixed, by constant stirring, 1% to 3% of oxide of lead, either litharge or red lead, or both, and a small proportion of oxide of manganese. When the oil reaches a temperature of about 500° F., it dissolves these metallic oxides, entering into chemical combination with them; and as these have a great attraction for oxygen, the resulting oil, which is much darker in color than it was, has also greatly increased drying powers, and paint made with it will dry in twenty-four hours. The dark color is due partly to the combined metallic substances and partly to heating the oil for a long time.

It is believed that more oil is present than can combine with the small amount of metallic oxides, and that the product is therefore composed of a small portion of oil combined with the lead and manganese, dissolved in a large portion of

oil, which is unchanged except that it has been darkened by heat. It has therefore become the custom of oil manufacturers to cook only a small portion of oil with the lead and manganese; and after these are dissolved, they stir the product into a large quantity of raw oil at a heat about that of boiling water. The boiled oil thus made is much paler in color than that made in the old way, and is said to be as good. It probably is more nearly uniform. But oil made in this way varies according to the amount of oxides used, the proportionate parts of lead and manganese and the heat employed, so that boiled oil from different makers is always different, varying much more than raw oil does.

The foregoing method is the one used by the large manufacturers, but smaller ones sometimes buy their oxides of lead and manganese already combined with just enough oil to make a compound. About four pounds constitute the protective film when a red-lead paint is dry, red lead being a mixture of the peroxide and the protoxide of lead, the latter ingredient being the substance known as litharge. The peroxide is believed to be the characteristic ingredient. Red lead is made by a fire process in a suitably constructed furnace, and furnaces of different construction, or even of the same plan but of different dimensions, give different products. "Commercially pure" red lead, composed of lead and oxygen, contains the peroxide in proportions ranging from 45% to 90%.

The oxide of lead combines with the oil, but the product is a solid cake. To liquefy this it is common to dissolve it in about two and one-half gallons of turpentine or benzine (or a mixture of the two), and this solution, which is a good example of what is called a "drier," which measures less than four gallons, contains enough metallic compound to go into about fifty gallons of oil. The small manufacturer or dealer opens a barrel of raw oil, takes out four or five gallons, fills it up with this drier (which he has purchased from some one who makes a specialty of it), closes the barrel, and, after rolling it about a little to mix it, sells it for boiled oil. Such oil is said to be boiled through the bung-hole, and is spoken of disrespectfully by the large manufacturers. Such oil is considered by some to be in every way equal to that made in a kettle.

## State Mine Inspectorship.

"Why do you not advocate the creation of a mining inspector in California?" is asked by Redding, Mariposa and Los Angeles correspondents. Chiefly because the manifest advantages of such inspection are (in the judgment of this paper) outweighed by the probable disadvantages. It is the old question of theory and practice. Ideally, State mine inspection is a good measure; protects miners, lessens accidents or liability thereto; places responsibility in case of accident, increases safety and deters loose methods and criminal negligence. That is, ideally. Practically, as things go, it may result in undue reliance on such inspection; in a shifting of responsibility; in the appointment of unfit men because of their political "pull;" in the creation of an office "just for what's in it." There are a few things in connection with this whole matter that must be kept in mind. The manager or superintendent of a mine must necessarily be something of an inspector himself. He doesn't owe his place to political influence, but to competence; and, if incompetent, he soon loses his job. The miner himself, who is supposed to be the chief beneficiary of government inspection, must keep his wits about him all the time, inspector or no inspector, and nothing in the way of management or inspection can take the place of such personal care. Anything that tends to lessen this ever-present feeling of the need of personal care lets in laxity; and wherever or whenever the miner gets the idea in his head that he need not exercise such constant care for his own personal safety, because some one else is paid by the State to look out for him, he is in greater danger than ever before. Post-mortem investigations and inquests are not as effective as ante-mortem vigilance. Argument after an accident as to whether the manager or the inspector or the miner himself was to blame for the disaster would be of infinitely less value than the continuous intelligent precaution against accident that characterizes the miner who realizes that, after all, his best protection lies in his own precaution and the necessary knowledge of his associates. So that, as far as this part of the question is considered, the existence of a government inspector would be a tacit implication that the miner didn't know enough to take care of himself. If there be in any American commonwealth such a body of miners, then they certainly should have an inspector. But the better way where such ignorance existed would be for those not possessed of the requisite knowledge of how to guard against danger to keep out of that kind of work. Then, again, where such inspection exists, there is a constant tendency on the

part of all hands to make a scapegoat of the inspector. There is at once a divided responsibility; in case of disaster the investigation disclosing the manager "blaming it onto" the inspector, and the inspector sometimes spying around to see if he can't get some way of blaming the manager for acting in ignorance or defiance of instructions.

The record of California commissions and inspectorships is not favorable to those who believe that a good man could be found to fill the place. There are plenty of "good" men; there is abundance of suitable material, but, as politics go, the really competent man wouldn't have it if he could and couldn't have it if he would. The fact that he was competent would be a bar to his appointment in some quarters, and the kind of man who could well discharge the duties attached to the position is usually employed at a better salary in a more satisfactory way.

There is a good deal of humbug about this mine inspection business, and at the bottom or top of it a flavor of demagoguery. In the belief that honest desire to protect the working miner actuates the idea, we hold that with intelligence on his part should go intelligent, competent management, and that the best way to insure such protection is not by putting a badge on a cheap "inspector," but by putting the full responsibility of his position on the mine superintendent or manager, and not allow chance for shifting such responsibility from the shoulders that should rightfully bear it. No inspection can fully take the place of the right kind of superintendence. Let the manager be made to take the consequences of his management. In case of there being an inspector, were there an accident, the first one blamed would be the inspector, which would be like blaming the constable or the sheriff if one man killed another. It would be unjust to the inspector to hold him responsible for what the superintendent or miners might do, but that is just what would happen, and, knowing this, no man really fit to fill the place would care to take such a position.

## Fraud in Oil Stocks.

It is with satisfaction is noticed the development of the oil industry of California, largely by reason of extensive scientific research, the results of which, during the last four years, as given in this paper, have demonstrated the extent and value of the oil bearing area. Through the years much had been said herein, but other matters were given more industrial prominence, and from 1887 to 1898 inclusive there had been produced only 10,605,167 barrels of petroleum in this State, of a value of \$12,600,985; but the series of articles referred to attracted such widespread attention and were so indisputably based on actual fact, that the matter taken in connection with the industrial development of the Pacific coast, its manufacturing requirements and the important factor of fuel, made manifest the need and profit of increased oil need, and when it was made apparent that California could be made first in the petroleum production, as it had been first in gold production, the present era of great oil production and development may be said to have begun.

Just now there is more activity in oil than in any other California mineral. A great amount of oil is being produced and meets with ready sale, and the outlook for greater increase in the production gives promise of double the present figures before a great time has elapsed, the demand keeping pace with the production. While it is extremely gratifying to note such development of one of California's many natural mineral resources, yet, some of the accompanying features can not be viewed with satisfaction. As in all commercial pursuits, there is a liability to overdo one form of demand and supply which seems to accompany all mining enterprises.

The companies now being organized in California are numbered by the thousand, and while praise and assistance should be accorded all with just reason for existence, yet the genus wildcat is multiplying too rapidly for safety, and the utmost stretch of constructive demand can not cover many of the manifestly fraudulent schemes now being worked in that direction. It is believed time to sound a note of warning against what is becoming a palpable fraud in the direction of "oil stocks." The legitimate development of the oil industry of the State is giving

place in many quarters to what is a craze for "investment" in these meretricious schemes, and the inevitable crash awaits the entire matter, with inevitably unfavorable result affecting the legitimate and illegitimate alike. Insanity seems to have taken the place of judgment in many investments, and the wily manipulators of the bogus companies apparently need but to point to the many examples of success to lure their victims into loss. Eastern papers, even technical mining journals, who know better, have flaring advertisements, making the most ridiculous claims and offering all sorts of statements, most of which are absolutely false.

It is always an unwelcome task to point out those things, but it is a duty owed to the industry to denounce them. This paper contented itself with demonstrating the extent and value of the oil deposits, showing the scientific method of going about the production of oil, thus laying the foundation for the solid superstructure of oil development in the State, but it has steadily refused to publish fraudulent statements and considers, as always, that it is doing the State a service in directing attention to the manifest worthlessness of so many of the present oil schemes, which are not intended to work the mine, but the street. There are few readers of this paper who would be likely to be lured into such ridiculous investments as that proffered by many of those fraudulent schemes in "oil," and the matter is referred to here solely as a protest against such overwhelming fraud. The dupes who lose their money deserve such loss, but the inevitable result must be to the detriment of the legitimate oil industry of the State, and it is the duty of those who are concerned in such legitimate development to aid in exposing the nature and extent of the fraud now being perpetrated by the wholesale.

With proper encouragement and development, the oil industry of the State of California may be made to assume gigantic dimensions, and so many other industries of the State are connected with such oil development that it is a matter of public importance that the windy promoters of these bogus companies shall not be permitted to injure the prosperity of the commonwealth.

The company that proposes to buy or lease land, to purchase machinery and develop the property acquired is to be commended and encouraged, but the bogus companies that have nothing and do not expect to do anything but "organize" and sell stock on the strength of lying advertisements are a curse to the State.

THE metric system is more and more referred to and used in these columns every year because it is the coming system of measurement. 'Tis thirty-five years since the United States by Congressional enactment made its use legal, and the present Congress is about to pass a law making the metric system the standard of weights and measures in this country. The whole subject is closely allied with scientific business progress. It is becoming of world-wide use; a world-wide business power like the United States needs it, as a part of universal trade development and expansion. Its scientific features are accurate and not arbitrary as are those of our present system; but the scientific aspect of the case was presented long ago. The use of the metric system is now a business necessity the same as any other modern method. It is no longer a question of argument, or like or dislike; the decimal in weights and measures means gain in dollars; the old system means loss. Business men have discovered that "it pays," and that settles it.

A COMMON mistake in a mining scheme is impatience—hurry for quick returns. Ordinarily when a new business is to be built up, investors rightly recognize the injustice of expecting immediate dividends therefrom. A mine must be made, and it is unjust and unbusinesslike to expect that it will begin paying dividends until after considerable outlay and necessary development. More than one good mine prospect has been spoiled by the haste and impatience of its co-owners, and no amount of ability or experience in the mine's manager nor of care and good intent on the part of the company directors can overcome the mischief made by a majority of mine stockholders who are in too great haste for dividends.

## Concentrates.

THE duty on imported cyanide of potassium is 25% ad valorem.

DROPPING 1, 5, 9, 7, 3, 2, 6, 10, 8, 4, in a 10-stamp battery should give good results.

IT is believed that 30 miles below the earth's surface is the greatest depth at which earthquakes are known to originate.

IT is not possible to "give a scientific definition of life." That which holds matter together, would probably be approximate.

MINING MEN visiting San Francisco are cordially invited to visit the MINING AND SCIENTIFIC PRESS office, where all may see their home papers, etc.

AN "ore shoot" refers to a body of ore in a ledge or vein; an "ore chute" is that through which ore is discharged from a stope or upper level to that below.

A CIRCULAR INCH is the area of a circle 1 inch in diameter—7854 square inch. A square foot = 183.35 circular inches. A square inch = 1.2732 circular inches.

THE Bay Counties Power Co. has transmitted electric power from the Yuba river to Vallejo, Cal., 120 miles. The Telluride Power Co., Utah, has transmitted 40,000 volts 32 miles.

THE presence of ammonium sulphate is not uncommon in flue dust, and in the liquid condensed from lead furnace fumes. It partially comes from the residue left in the coke and furnace gases.

THE question of permitting the erection of sawmills in forest reservations is now before the General Land Office. It is probable that a limited number of permits will be issued with stringent regulations.

RECORDS of experiences in mining and milling would be of interest and value, and our readers are invited to send such notes of such experience as contribution to the common stock of general knowledge and information.

BAD and loose surveying is exceedingly expensive; there is no system so conducive to true economy as accuracy. Of recent years the method of surveying and plotting by co-ordinates has been extensively adopted.

IN mining the term "apex" does not mean a point. It means the top of the ledge or lode, that which comes nearest the surface. The part from foot wall to hanging wall at the top of the lode nearest the surface is the apex.

ORDINARILY in the bed of a water course, a current or continuous movement of the water of 3 inches per second will scour fine clay; 6 inches, fine sand; 9 inches, coarse sand; 12 inches, fine gravel; 2 feet, round pebbles 1 inch in diameter; 3 feet, angular stones, 2 inches diameter.

ELECTRIC flashlight signals are in use in deep mines in Butte, Mont., Leadville, Colo., and elsewhere, and are feasible wherever there is an equipment of electric lights. They are deemed superior to the electric bell system, the insulation of which in a wet mine is constantly interfered with.

THE amount of zinc used in the cyanide process is a very small percentage of the total zinc production. Assuming that 20,000,000 tons are annually treated and that one pound of zinc per ton is used, that would be only 10,000 tons required, or about 1% of the world's production.

A GAS ENGINE will develop equal power using 10% less distillate than gasoline; 50 gravity distillate costs 11½ cents per gallon, gasoline 17 cents, in California. Distillate is cheaper than gasoline, but more likely to be dirty. A 60 H. P. engine will use about seventy gallons gasoline per ten hours.

SEVERAL American metal mines are considerably below ocean level, notably in California and Michigan. The bottom of the deepest shaft of the Calumet & Hecla is nearly three-fourths of a mile below the level of the ocean. The bottom of the Kennedy mine, Cal., is nearly 1000 feet below sea level.

THE mil and circular mil are used in electrical calculations in which may be involved area or diameter of wires. One mil is .001 inch in diameter; a circular mil is the area of a circle 1 mil (.001 inch) diameter. One square inch = 1,273,239 circular mils. One circular inch = 1,000,000 circular mils.

IN the cases now being argued before the U. S. Circuit Court of Appeals in San Francisco, involving titles to mining claims in Nome, the point to be determined is the right of title to a claim which has been located by an alien and subsequently transferred to a citizen, a third person locating the claim after the transfer had been made.

WATER GAS may be made by passing steam through incandescent anthracite coal, the resultant gas passing to a carburetor, where it receives the necessary hydrocarbon from petroleum. In a third cylinder a superheater raises it to a high temperature and frees the gas from pyroligneous acid. It is subsequently passed through conduits, in which it is freed from ammonia and sulphur.

THAT new mining districts are not found more frequently is due in some respects to the miner restricting his search for ore to those formations and to that character of ore with which he is familiar, and may, therefore, for a lifetime walk daily over high-grade ore in plain sight, which in appearance so differs from his

notions of what constitutes an ore that he regards it as barren rock.

GIANT or other powder should not be stored in tunnels, or underground at all; to store, say, 400 cases, there should be a magazine, properly ventilated, about 14x16 feet; 10 feet in the clear; the bottom row on slats, then slats on top of the first row of cases, and so on. The nitro-glycerine in giant freezes at 46° F. (14° above the freezing point of water), and powder may become chilled without being actually frozen.

ADVERTISERS in this publication should be favored by our readers in placing orders. Those who advertise seek trade and it is business to patronize those who want your business. Besides, it is our advertisers who enable us to furnish this journal for \$3 a year. Were it not for the advertisers, fifty-two copies of a paper like this could not be delivered for twice the money. Hence in helping your business those who advertise herein you help yourself.

IN a case decided by the Supreme Court of the State of Montana—Yaux vs. Bordeaux, 58 Pac. Rept., 42—where the lessees of a mine had agreed to operate a mine in consideration of the owners furnishing all necessary supplies, "the net proceeds" of the ore after milling to be divided between the owner and lessees, it was held that in determining "the net proceeds," only the cost of smelting, and not the cost of mining, hoisting and handling the ore should be deducted from the gross proceeds.

IN the treatment of ores with solutions of cyanide, the cyanide dissolves the free metal, which is generally gold, so long as free oxygen or its equivalent is present, and subsequently any remaining cyanide attacks the compounds of its base metals; hence, when comparatively much cyanide and little oxygen is present, as in strong cyanide solutions, much base metal and little gold is dissolved; but in dilute cyanide solutions the conditions are reversed, and so, also, is the result, so that much gold and but little base metal pass into solution.

THE use of "technical terms" can not be avoided in discussing technical subjects. A "technical" term is usually an exact term, a word that in connection with the subject could not well be replaced by any other. Every business or pursuit has its "technical" terms applying to that particular calling and of unavoidable use in discussion thereof. Mining and metallurgy have no more than other pursuits or sciences. There is an exact precision about a technical term that renders necessary its use in law, hod carrying, navigation, mining, poker, ore concentration, and other exact sciences.

BOWMAN'S dam was built in 1872 near Cisco, Cal., in the foothills of the Sierra Nevada, on a tributary of the South Yuba river, and holds 450,000 miners' inches. The surface area is 502 acres; the dam is in a narrow gorge at the outlet of the valley, and is 425 feet long, 100 feet high, made of cedar and tamarack, forming a crib firmly bolted together and filled with rubble stone. The base, 15 feet thick, diminishes to 6 feet on top, the stones composing the wall weighing from one to five tons each. The facing of the dam above the 60-foot mark is of heavy sugarpine planks, firmly spiked to 8-inch cedar ribs fastened to the main crib by long iron bolts.

U. S. SENATOR STEWART from the Senate committee on mines and mining this week reported a substitute for the mining bill heretofore introduced by himself. The substitute prohibits any person from locating a mining claim, lode or placer for any other person, corporation or association. The substitute also authorizes the purchase from the Government of land believed to contain oil at the price of \$2.50 per acre. It is designed to enable any U. S. citizen to file on 160 acres of unclaimed vacant land "which he believes contains valuable quantities of oil," such filing to give control of the land for six months, during or at the end of which time the land must be paid for.

ROCK in place and the ore therein unworked is real estate. If separated therefrom by artificial means with intent of such separation the mineral becomes personalty. If detached by natural causes, it remains part of the real estate. In common law, tailings belong to the mine owner, while on the mine premises; if permitted to go outside the mine boundaries they become subject to outside claim; but in some States—Idaho, Utah, Montana, California and Colorado—the mine owner can acquire as by eminent domain dumping ground, or right of way for tailings and other mine debris. Meanwhile, if the matter be one of much money importance, the advice of an expert mining lawyer is in order.

INDUCTION or inductance is that property in virtue of which a finite electromotive force, acting on a circuit, does not immediately generate the full current due to its resistance, and when the electromotive force is withdrawn time is required for the current strength to fall to zero; a quality by virtue of which the passage of an electric current is necessarily accompanied by the absorption of electric energy in the formation of a magnetic field. Induction or inductance, so far as it affects the carrying capacity of a conductor, is purely a phenomenon of variable currents. Its effect is to introduce a sort of spurious resistance, its mechanical analogue being inertia. In resistance coils the wire is usually wound non-inductively simply to insure the absence of this spurious resistance. Current from a battery, for instance, is for comparatively long intervals perfectly constant, so that resistances to be used on battery circuits if not subjected to outside influences might just as well be wound inductively as non-inductively. The dynamo current, however, is never quite constant—it is always, to a

certain extent, pulsating, and this pulsation, however slight, would introduce self-induction in the coil were it not wound non-inductively, which would modify its apparent value as a resistance. One can never be quite sure that induction from other circuits may affect the coil, hence the practice of winding non-inductively.

THE result of a grounded circuit in an ordinary isolated lighting circuit is that a portion of the current passes to the earth and represents a direct loss. When a ground occurs on a lighting circuit the brilliancy of the lamp will be reduced, if the machine is well loaded, and if the brilliancy be restored it will add slightly to the load on the dynamo. Beyond this there would be little effect noted at the machine if the area of the brushes be sufficient to take off the current. In a grounded circuit, such as an ordinary railroad circuit, one pole of the generator is put to the ground and the other connected with the line. The only effect that this has on the generator is to change the strain due to full voltage of the generator upon insulation from the coils to the frame.

TO SEPARATE gold and platinum, the metal is digested with nitric acid, specific gravity 1.199, as long as any silver dissolves. The metal is then washed and digested with aqua regia (composed of 100 concentrated HCL, 43 concentrated HNO<sub>3</sub>, 143 vols H<sub>2</sub>O) until the silver chloride forming on the surface of the metal prevents further action. The solution of gold is then poured off and the silver chloride is removed by treatment with dilute ammonia, when the metal is again in condition for further treatment with aqua regia. After six alternate treatments with aqua regia and ammonia the residual metal consists of pure gold. The acid solution containing the gold is evaporated with excess of hydrochloric acid to drive off nitric acid, until gold chloride crystallizes out. This is then dissolved and a small amount of platinum removed by adding ammonium chloride, the gold finally precipitated by ferrous sulphate.

FOR a volumetric determination of copper by potassium cyanide solution, dissolve 10 grams of potassium cyanide in 250 cc. of water and mix thoroughly. Weigh 2 grams of pure copper wire, transfer to a one-fourth-liter flask, add 25 cc. nitric acid, and warm gently until the copper is all dissolved; boil to expel oxides of nitrogen; cool, dilute with water to the mark, and mix well. Take 50 cc. of this copper solution, transfer to a No. 3 beaker, add ammonium hydroxide until the precipitate formed dissolves and the solution is alkaline. Fill a 50 cc. burette with the potassium cyanide solution, and gradually drop the cyanide solution into the copper solution until the blue color disappears and the solution becomes colorless. Note the number of cubic centimeters of potassium cyanide solution required to do this, and mark upon the potassium cyanide bottle the value of 1 cc. in terms of copper. Thus: suppose 50 cc. of the copper solution required 31.3 cc. of potassium cyanide solution; then 31.3 cc. KCN equals 0.40 gram Cu, and 1 cc. KCN equals 0.0127 gram Cu. Having thus obtained the value of the potassium cyanide solution, it can be used for determining percentages of copper in alloys, bronzes, etc. For example, brass: Two grams of brass are weighed out and treated with 25 cc. nitric acid and the solution made up to 250 cc. Fifty cc. of this solution are made alkaline with ammonium hydroxide, and titrated with the potassium cyanide solution. Having determined the number of cubic centimeters of potassium cyanide solution required to decolorize the 50 cc. of the brass solution, the percentage of copper is calculated from the above data.

SULPHIDE ORES (if not roasted) and ores with calcite, dolomite and manganese are not adapted for chlorination, as they use up too much chlorine. A test for suitability of ores for chlorination may be carried on as follows: Place the completely roasted sample in an ordinary sodawater bottle with enough water to make the whole of the consistency of thin mud. The ore and water should together occupy about two-thirds of the bottle. Bleaching powder and a thin glass bulb filled with dilute sulphuric acid are then to be added, and the bottle securely closed. As cork is attacked by chlorine, glass or vulcanite stoppers are better; the screw-stoppered bottles are most convenient. If a cork is used, it must be wired down. The bottle is then shaken so as to break the sulphuric acid bulb and mix its contents with the bleaching powder, when chlorine is evolved. The bottle is now left for several hours in a warm place, being shaken occasionally by hand to mix its contents. At the end of ten or twelve hours the bottle is opened, and, if excess of chlorine is still present, the liquid is separated from the ore and the latter washed thoroughly by filtration or decantation. The liquid and washings, whether clear or muddy, are warmed to expel free chlorine, and an excess of ferrous sulphate is then added to them. The precipitate is collected, scorified with lead, and cupelled. In all cases it is better to keep the first liquid separate from the washings, which should be concentrated by evaporation, since if this is not done the precipitate of gold may be too fine to settle and will pass through filter paper. A better method of precipitation is to boil the liquid with iron filings for a few minutes, decant through filter paper, wash the filings, and dissolve them in dilute sulphuric acid, when a residue of gold is obtained which is easy to filter. Bromine may be used instead of the materials generating chlorine. The quantities of chemicals required will be such as are sufficient to generate a volume of chlorine equal to twice the capacity of the bottle used, or a solution of 2% of bromine in water works well.

## Stamp Mill Steam Practice.

Written for the MINING AND SCIENTIFIC PRESS by  
A. W. WARWICK.

A careful examination of a very large number of stamp mills, in different Western States, has shown that the power plant of such mills is the most inefficient portion of the mill. It is pitiable to see a millman strain every nerve to save a fraction of a cent per ton, in quick or screens, when the engines and boilers are losing dollars every day. These remarks apply, of course, only to the 5 and 10-stamp mills, such as one ordinarily sees, although there are occasional exceptions. In the large stamp mills of such concerns as the Montana, Ltd., and the Homestake the steam practice is as good as it can be.

Carefully kept statistics show that the average consumption of coal in the little 5 and 10-stamp mills is not less than seven pounds per horse power hour. There is no reason in the world why it should exceed four pounds. With coal—or its equivalent—at \$5 per ton, this loss amounts to \$4.50 daily in a 10-stamp mill, or say 15 cents per ton of ore. This loss is caused by (1) engines with throttling governors, (2) engines being too large or too small, (3) lack of water heaters, (4) insufficient protection of steam pipes and boilers.

In putting engines and boilers into these mills the designer or erector seems to be guided by one or other of two principles: (1) to have power enough so that the mill can be enlarged at some future date, (2) to get "cheap" power. The man who puts in a cheap steam plant, except in the case where he cannot afford the money for a good outfit, is not a fit person to engage in mining. The best is the cheapest in milling and mining, as in everything else. We will not consider this case. There is something to be said, however, in the other case, for the intentions are good.

Without going into details of steam practice, it may be stated that every engine has its economical load—in other words, it does not pay either to overload or underload an engine. For an automatic cut-off engine (and no other should be used) the economical load is being carried when the valve cuts off at from  $\frac{1}{4}$  to  $\frac{1}{2}$  the stroke. At this cut-off an ordinary 30–40 H. P. engine will use about twenty-five pounds steam per horse power hour. When the engine is underloaded, so that it will cut off at  $\frac{1}{10}$  to  $\frac{1}{2}$  of the stroke, the steam consumption will be at least thirty-two pounds per horse power hour. Now, when the engine in a 10-stamp mill is large enough for a 20-stamp mill—say a 60 H. P. engine—just this case occurs. When an automatic cut-off engine is overloaded the cut-off adjusts itself to the load, the point at which it cuts off being  $\frac{1}{2}$  or more of the length of the stroke, and full advantage cannot be obtained of the expansive qualities of the steam. Hence a loss of fuel. Let us see the annual coal bill of a mill in one case where the engine is proportioned to its work, in another where the engine is capable of doing twice the work. These figures are not hypothetical, but are based on actual personal experience.

(1) Mill engine developing 33 I. H. P. at  $\frac{1}{2}$  cut-off; evaporation of coal,  $7\frac{1}{2}$  pounds water, using exhaust steam heater; 40 H. P. boiler:

|                                                    |         |
|----------------------------------------------------|---------|
| Daily coal consumption, 2376 lbs., \$4.50 per ton. | \$ 5.34 |
| Cost per ton ore.....                              | 17.8    |

Yearly coal bill at 350 working days.....\$1869.00

(2) Mill engine developing 35 I. H. P. at  $\frac{1}{2}$  cut-off; evaporation of coal, 7 pounds water, using exhaust steam heater; 80 H. P. boiler:

|                                                    |         |
|----------------------------------------------------|---------|
| Daily coal consumption, 3768 lbs., \$4.50 per ton. | \$ 8.47 |
| Cost per ton ore.....                              | 28.2    |

Yearly coal bill at 350 working days.....\$2963.00

A difference of \$1094 per annum, and 10.4 cents per ton in working costs, in favor of the smaller engine.

We will return now to the man who wants an engine "big enough" or the man who is so enthusiastic as to believe that his plant will be doubled or trebled in size in a very short time. For answer to the first man we would say that having regard to our coal bill we want an engine large enough, of course, but when it comes to an engine larger than our needs we respectfully differ. To the second man we would say, that in not once out of ten times is a 10-stamp mill enlarged to a 30 or even 20-stamp outfit; also that in the occasional case of enlargement the increase hardly ever occurs within a year or two of the time set. The policy the writer would adopt would be to put in an engine of the right size. Then, if within a couple of years, owing to a happy combination of circumstances, the plant were enlarged to twenty stamps he would put in an engine, suitable to its load, to drive the larger mill, at a cost of not to exceed \$2000. In the two years \$2188 would have been saved in fuel, in addition to the difference in interest of the two plants. So that the saving in coal would pay for the new engine and boiler and the old engine and boiler would still be on hand to do other useful work if needed; anyhow it will be on hand and you will have two outfits for the cost of one.

An exhaust steam heater is a necessity in a steam

plant of almost any size. The ordinary little heater filled with small tubes is a nuisance. It speedily chokes up with incrustation and is a great trouble to clean. A heater of the tray order, such as the Hoppe, is the only kind to buy. The functions of a heater are two: first to feed hot water to the boiler, second to keep the boiler free from incrustation. In both cases fuel is saved when exhaust steam is used. A heater saves 1% in fuel for every rise of 11° that it heats the water sent to the boiler. If, therefore, the heater raises the feed water from 60° to 200° then a saving of  $\frac{1}{10}$  or 12% is effected. In reality it is more than this, owing to the absence of incrustation in the boiler.

In selecting the engine nothing but an automatic cut-off engine should be used. It is true that such an engine runs at a higher speed than a throttling governor engine but this is readily adjusted by pulley sizes. The difference in coal consumption is immense; the writer would not have a throttling governor engine in a mill on any condition. For a 30-stamp mill or larger nothing but a Corliss engine should be considered. As for the boiler, up to 60 H. P. the ordinary return flue boiler would be a good selection. Beyond that, and up to 100 H. P., a water tube boiler of standard make may well be considered, and above 100 H. P. a good water tube boiler is emphatically the best. A "freak" boiler should on no account be even thought of: only a good standard make should be selected.

The foregoing considerations on the selection of the units in the motive power naturally lead up to the question of the power required by a stamp mill. The following figures, which are from one of many tests made, show the power consumed by a 10-stamp mill of 850-pound stamps, 6-inch drops, ninety per minute:

|                           | Actual H. P. |
|---------------------------|--------------|
| Ten stamps.....           | 17.85        |
| 7x10 rock breaker.....    | 4.95         |
| Two 6-foot vanners.....   | 2.50         |
| Friction of shafting..... | 5.30         |
| Total.....                | 30.60        |

This does not include friction of engine.

In a preceding article the writer has shown the method of calculating the power required by a stamp head. From the formulæ given the power required for any other stamp mill can be calculated, taking as the total horse power required the sum of the following: 1. Horse power of stamps alone. 2. Power for running rock breaker. 3. Power for the concentrating machines, if used. 4. Friction of mill shafting. However, in designing a new mill, the length of drop the ore may require is uncertain. A good mill man with a large coefficient of experience can come pretty nearly judging the drop required by a certain ore with a given weight of stamp. If he thinks a 6-inch drop would be needed, in figuring on the power he may well use a 7-inch drop; then, should perchance an 8-inch drop be needed, the slight increase of power required could readily be taken care of by the engine without, practically, any loss in efficiency. The following table gives the actual power used by 850-pound stamps falling 6, 7, 8 inches ninety times per minute; H. P. shown by indicator diagrams:

|                  |             |
|------------------|-------------|
| 6-inch drop..... | 1.785 H. P. |
| 7-inch drop..... | 2.112 H. P. |
| 8-inch drop..... | 2.430 H. P. |

In figuring on the rock breaker, the power may be taken as that given by the various foundries in their catalogues, although as a general rule the power given is too high. The power required by a rock breaker is a very variable amount, depending upon (1) manner of feeding, (2) character of rock, (3) condition of machine. In figuring the power the machine shops allow a certain amount for friction of transmission shafting, which the writer always figures separately. The following figures show the power required by three different rock breakers on fair ordinary ore:

|                           |           |
|---------------------------|-----------|
| 7 x 10 breaker (Blake)... | 5.0 H. P. |
| 8 x 12 " ".....           | 6.5 "     |
| 9 x 15 " ".....           | 9.25 "    |

Still, for a hard saccharine quartz it might be well to raise these powers 25%.

The power used for any concentrating machinery will have to be allowed for from the estimates of the makers. It is, however, for a small stamp mill very slight. For a 4-foot Frue vanner the writer uses  $\frac{1}{2}$  H. P.; for a 6-foot Frue,  $1\frac{1}{2}$  H. P.; for a Wilfley table,  $1\frac{1}{2}$  H. P.

After summing up the power for the rock breaker, stamps and concentrates, a certain amount should be added for friction—generally 20%. It is well enough to allow sufficient power for friction, but no stamp mill should require 20% of the total usefully applied power to overcome friction; 15% should more than cover it. The practice of having an oiler going around with a handful of waste and an oil can is a barbarity, especially in a stamp mill, where grease is so harmful. By such a method of oiling, grit inevitably gets in the bearings; if this is denied—and such has been done—it can not be denied that under such circumstances the bearing is at times flooded with oil and at others quite dry. The only method is to have lubricators, such as the very simple needle-lubricator; very slight attention to these once or twice a week, and using a suitable lubricant, will ma-

terially lessen the friction and abolish hot bearings, with all that the latter implies—increased power and danger of fire.

To obtain the indicated horse power it is necessary to add the engine friction. This will vary with the type of engine, and can be furnished by the engine makers. For a good make of simple, non-condensing, automatic cut-off engine, 5% of the economical load may be used where no other data is available.

By lack of care in design or in running the steam plant of a stamp mill, an increase of 10 to 15 cents per ton in cost of milling is readily made.

## Massachusetts Chemical Company's Water Wheel Plant.

The accompanying engraving is of a 33-inch cylinder gate Victor turbine, recently furnished to the Massachusetts Chemical Co., Walpole, Mass. There is nothing novel in the setting of the water wheel, but the combination of the water wheel and the generator, new in some parts of the country. The wheel operates under about 14-foot head, developing about 115 H. P. at 150 revolutions per minute. The wheel is set in a steel flume with cast-iron heads, the water being conveyed to the flume by means of a steel feeder pipe. The flume stands on I beams across the

pit, with the customary draft tube leading from the wheel to the tail water. Floor space in this particular case, however, was valuable and for that reason the generator was mounted directly on top of the water wheel shaft, the shaft through the armature being an extension of the water wheel shaft. The generator is a direct-current machine.

The weight of the armature is carried by means of a thrust bearing, which is a combination of rings and pressure running in oil. This bearing is mounted on top of the flume cover immediately underneath the armature of the generator, making a complete outfit, unique in its way, and one that could be used to advantage in many places where light powers are to be developed. Further particulars may be had from the designers and manufacturers, The Stilwell-Bierce & Smith-Vaile Co., 276 Lehman St., Dayton, Ohio.

## A Disputed Statement.

TO THE EDITOR:—The statement that if an ounce of iron and a ton of iron were dropped from the same vertical height at the same time, the ounce piece would reach the ground first, because of the resistance of the air, is not correct, because if we take a sphere for example, as the resistance for any given velocity is nearly in proportion to the area exposed to atmospheric resistance, which would be the area of a great circle of the sphere, it follows that the atmospheric resistance varies nearly as the square of the diameter, while the mass or weight varies as the cube of the diameter. From this it will be seen that the ratio of the atmospheric resistance to the weight, for bodies of a given density, traveling at the same velocity, decreases as the size of the body increases and therefore the ton of iron would reach the ground before the ounce of iron.

Deadwood, S. D., Jan. 26.

## Exhibit at Buffalo, N. Y.\*

At the Pan-American Exposition at Buffalo, N. Y., will be an exhibit of mines and metallurgy. The building to be devoted to these purposes is one of a group of three structures arranged in the form of a horseshoe, at the western boundary of the Esplanade. The Mines building is the southernmost of the group and is 150 feet square; at each of the four corners it has a square tower 90 feet high. The eastern facade, looking upon the Esplanade, shows three high recessed arches between the towers, forming an open loggia, ornamented with plastic detail and decorated in brilliant colors. From this loggia are the main entrances to the building. There are also entrances in the corner towers.

\*See illustration front page.

## Concentrating Tests and Calculations.\*

OTTO F. PFORDTE.

The great advance of the last twenty years in the specialization, delicacy and efficiency of ore concentrating apparatus calls for a finer system of testing both the qualities of the ores and the operations of machines in this department. In amalgamation, lixiviation and smelting the daily employment of physical and chemical tests has been recognized as necessary, and the cost of the necessary laboratories and employees is cheerfully paid. But while much progress has been made in concentration—due, in a large degree, to the study of the subject in our technical schools—it is still too common in actual practice to follow the loose old method of roughly estimating, once for all, that a given ore "concentrates  $x$  tons into one," and resting on this assumption so long as that ore continues to be treated, while assays of the tailings from concentration are made from time to time, without exact determination of their quantity.

The first step toward accuracy of control must be a more frequent and precise measurement of the quantity of concentrates from a given operation. This should be expressed in pounds per unit of one ton, and the variations shown in frequent determinations will furnish a constant check upon the character of the ore and the performance of the apparatus. But this is only a part of what should be constantly and systematically done to insure the best work upon a material which must vary continually, even though it come from one mine only.

If, in any mill, appropriate laboratory tests were made at least once a week, the labor and expense involved would be amply repaid by increased knowledge and control of the current operations.

A small testing laboratory, provided with a few gold pans, vanning plaques, coarse and fine scales (the former weighing to 2000 and the latter to 50 or 100 grammes, with 5 to 10 milligramme indications), a water trough, a wash bottle, a water faucet (if conveniently practicable), a small drying oven and a set of sizing screens would suffice for the ordinary control of mill work.

For testing new ores, a mortar and pestle and a simple apparatus for fine grinding should be added; and for some tests of special delicacy and complication a small spitzlutte and a testing jig would be useful. The total cost of the apparatus would be so small, in view of the economic results to be secured, that it would be wise to furnish at the outset all the conveniences likely to be required.

In discussing the use of such a laboratory (in connection with the assay office, the existence of which is assumed), certain well-known principles must be borne in mind. It is unnecessary to do more than to enumerate them:

1. It is commercially impracticable to concentrate any ore without some loss of valuable material. If the concentrates are pure, the loss in the tailings will be so much higher. If the tailings are barren, there will be so much more worthless material in the concentrates, which will consequently be of lower value per ton.

2. Whether a smaller or larger amount of gangue can be economically allowed in the concentrates will depend partly on the ore itself, partly on local conditions—such as cost of labor, freight and smelting—and, finally, on the capacity of the machinery to treat, without overdriving, detrimental to technical efficiency, a given amount of ore daily.

3. Every laboratory test should always be of the general nature as that of the corresponding operation in practice, but more careful and accurate in degree.

4. The difficulty of concentrating an ore increases directly with the number of substances to be separated, and inversely with the difference between the specific gravity of the lightest of the useful materials to be saved and that of the heaviest minerals of the useless gangue from which they are to be separated. When these specific gravities are equal, no satisfactory separation can take place.

5. In the tests, as well as in actual practice, sliming is to be avoided as far as possible by crushing the ores as coarsely as is consistent with the best separation.

6. Assays serve to determine commercial values, but give no exact clue to the "concentrating character" of an ore, or the operation of the concentrating apparatus. That is to say, the practically perfect or imperfect concentration of an ore is entirely independent of its commercial value.

7. Each concentrating ore furnishes its own standard of a theoretically perfect concentration, and this standard varies not only for ores from different mines, but also, at different times, for ores from the same mine.

TESTS TO BE APPLIED IN A CONCENTRATING MILL.—Assuming such a mill to be provided with an assay office and a testing laboratory, as proposed above, we may outline the advisable tests as follows:

As convenient, take a daily or weekly pulp sample; weigh out 2000 grammes; concentrate carefully in the gold pans or vanning plaques; dry the resulting concentrates and weigh in grammes. Each gramme

of concentrates thus obtained represents 1 pound per ton of ore.

The weights and assays found by the test should fairly correspond with the actual weights and assays of the concentrates for each ton of ore crushed. The corresponding tailings of the test should also be assayed, and the results should agree fairly with practice.

These tests and assays should be made at regular intervals, and records of them should be either kept in figures or graphically plotted in a continuous broken line, and continually compared with the actual mill results. This procedure will show the practicable standard of concentration, and detect at once any failure of the mill apparatus to do its best work for the given conditions.

Moreover, not only these formal tests but also occasional informal daily tests of the tailings should be made by taking a small but uniform quantity each time, and, without drying or weighing, washing it down in the pan or plaque, and making a mental comparison with previous tests as to the amount of valuable mineral lost.

Inaccuracies in the operation of the concentrating machinery may thus be detected and remedied much more quickly than by the longer and sometimes impracticable process of assay tests.

TESTS TO BE APPLIED TO NEW ORES.—A sample may either be pulverized or in larger pieces. In the first case weigh out 2000 grammes or a proportional quantity, according to the size of the sample; concentrate carefully in pan and plaque, and note all the constituents of ore and gangue, using a magnifying glass if necessary. Dry and weigh the concentrates. Each gramme (or proportional part) represents 1 pound per ton. Assay the pulp, concentrates and tailings to obtain data for calculation. Due account of the slimes should be taken, as the sample may have been ground unnecessarily fine. In case of a massive sample, inspect and then crush, screening frequently through a 30 to 40-mesh screen, to avoid sliming as far as possible, and proceed as stated above, not omitting inspection on the vanning plaque, where some substance may appear which escaped detection in the massive piece. In cases where the valuable mineral is very coarse and suitable for jig concentration, employ coarse crushing, using say from 8 to 20-mesh screens. Separate the coarse from the fine material on a screen of about 30-mesh per inch; treat the former by jigging and the latter by pan or vanning plaque; dry, weigh and assay the results separately. The assays of the tailings should fairly agree. The jig tailings may be a little higher than the rest, for which the ore amply compensates in practice by the larger amount crushed and the decreased tendency to sliming.

This operation will also give a fair idea of the screen size best adapted for jig work, as it is desirable, in the great majority of cases, to avoid recrushing the jig tailings. Incidentally, assays may also be made of the various selected pure mineral constituents of the ore, to ascertain which of them carries the chief values.

Such tests on new ores are, however, not intended to replace the customary mill runs, but merely as preliminary inquiries, reaching quick and fairly accurate results, which may render unnecessary the making of expensive mill tests on unknown ores.

When the preliminary tests have given favorable results, it is very desirable—in fact, essential—to make a trial run of several tons with the proper mill machinery before incurring further expense.

CALCULATIONS UPON CONCENTRATING ORES.—In calculating the concentrating properties of an ore it must be remembered, first, that the total metallic contents of an ore, or of its products in concentrates and tailings, are entirely independent of the degree to which concentration is carried; secondly, that the assay value of the concentrates, in perfect work, increases in proportion as the concentration proceeds, until finally, when all metallic and barren materials have been separated, further mechanical concentration ceases. Therefore, when the assay and ratio of a concentrating ore are given, the amount and assay of the concentrates are readily obtained.

To use a simple illustration: Let us assume a perfect concentration of an ore assaying 12 ounces of Ag per ton and 3% of Pb and 2% of Cu (which corresponds to 12 ounces of Ag, 60 pounds of Pb and 40 pounds of Cu per ton). Let 1 ton of this concentrate to 275 pounds. Then the concentration is 2000 to 275, or 7.27 tons into 1, which is used as a factor for multiplying the results of the ore assays to obtain the corresponding theoretical assays of the concentrates. In this case it is found that 7.27 times the assay results of the ore given for the concentrates equal 87.24 ounces Ag per ton, 21.81% Pb and 14.54% Cu per ton, assuming that all the metal contained in the original ore is collected in the concentrates.

However, as such a perfect concentration is impossible, a practicable standard must be established. This is done by careful concentrating tests, in which the unavoidable loss depending on the nature of the ore is determined. Suppose that, in the last example, this loss in tailings has been found to be one-tenth of the assay value of each mineral constituent, although the concentrating ratio remains the same, as the lost mineral has been replaced by gangue. Of course, the percentage of loss of the various minerals

is not really uniform, so that for each metal this loss must be determined separately. For simplicity only, a uniform loss of one-tenth is here adopted.

By difference it is found that 10.8 ounces of Ag, 54 pounds of Pb and 36 pounds of Cu would be available for extraction if an entire ton of tailings, containing 1.2 ounces of Ag, 0.3% of Pb and 0.2% of Cu, had been lost. But as only  $\frac{2000 - 275}{2000}$  tons were lost,

this figure becomes a factor for the Ag, Pb and Cu of the tailings, reducing the actual losses to 1.04 ounces of Ag, 5.18 pounds of Pb and 3.45 pounds of Cu, which, subtracted from the contents of the ore, will leave 10.96 ounces of Ag, 54.82 pounds of Pb and 36.55 pounds of Cu as the available mineral in the ore. From these figures the percentage of extraction is readily obtained.

The variations in concentrating ores are infinite, but by the method sketched above a practicable standard can readily be established for each individual ore, which may be considered as constant, within a reasonable limit of time, for ores from the same mine.

## Clear Creek County, Colo., Tunnel Work.

What is known as the Newhouse tunnel is the property of the Argo Mining, Drainage & Transportation Co., of which L. Hanchett is manager. The tunnel is projected to run from a point below the town of Idaho Springs, Clear Creek county, to Eureka gulch, a short distance above Central City, Gilpin county, cutting through Seaton mountain, Russell Gulch district and Quartz hill, the total distance being about 20,000 feet. It crosscuts a number of well known veins and cuts about 1700 feet vertically below the highest points in its course, which makes about 2000 feet on the incline of the veins. The work has progressed about 10,000 feet, which takes it to a point below the summit between Clear creek and Russell gulch. The bore of the tunnel is larger than the usual size, is double-tracked and has 4-inch pipe for compressed air and 18-inch pipe for ventilation. The material is hauled out by mule power. The drill work is being done by three Leyner air drills. The entire course of the tunnel is in a straight line. So far as ascertained, the enterprise has the friendly co-operation of the surface owners along its course, the tunnel company having contracts, which relates to transportation of material, with the principal mine owners. It owns numerous claims on the surface and proposes to lease other territory. On the Seaton mountain side the deepest workings from the surface are 800 to 900 feet, and the fact that the tunnel company find good ore in the same veins from 800 to 1000 feet lower convinces all that in this section the ore bodies go down, carrying their values with them.

The Gem Extension and Freighters' Friend are much interested in the veins cut by the tunnel below them, and it is likely some connection with the latter will be made. Both these properties, which are well developed, are good shippers; the former is in charge of W. E. Renshaw and the latter is managed by John Owens.

The Sun and Moon, under the management of H. N. Sims, comprises a group a short distance north of the Gem and Freighters' Friend, near the head of Gilson gulch. Here is a vein of ore trending east and west, which is also crosscut by the Newhouse tunnel. An incline shaft sinks 800 feet, from which drifts on the vein have been run at 100-foot stations. The principal work now in progress is on the drifts and stopes of the fifth, sixth and seventh levels. The vein walls are 4 to 7 feet apart, the material between them being partially decomposed quartz, clay and talc, supporting a well defined streak of lead and iron sulphide, which carries from 2½ to 3½ ounces gold and 3 to 5 ounces silver. The streak, however, is comparatively narrow. The eighth level has not yet been developed. At the bottom of the incline is a sump from which water is constantly pumped. In this mine the Schmucker air drill is in use—a view of one of the stopes, with drill in operation, being given herewith.\*

E. D. Quigley, with whom various Eastern parties are interested, has charge of groups known as the Bellman, Brighton, Lead Belt and Mix—the first two named being small shippers. Mr. Quigley has also started a tunnel from a point west of Virginia canyon, having driven 375 feet.

In the Roberts mill the manager, J. G. Roberts, is making some tests on a vibrating, double-decked spiral plane concentrating table, built and patented by W. E. Wild and Howard S. Bailey. The work it does on the ores of the district, which are a lead and iron sulphide, is deemed very satisfactory by Mr. Roberts.

The Seaton M. & M. Co., under the management of J. J. May, perhaps ships the largest tonnage of any mine in the district at present, the ore being mostly smelting material.

The Alma Co., which has control of a group north of the Seaton, owns the Foxhall tunnel, which goes in 1300 feet, from the level of which a shaft will now be sunk.

Idaho Springs, Feb. 20, 1901.

## Treatment of Tailings.

In the treatment of tailings by the direct-filling process, the vat that is filled with tailings from the battery is treated directly by cyanide, instead of the contents being discharged into another vat for treatment, the usual intermediate or settling vats being dispensed with. Before the cessation of work in the South African gold fields because of the war, there were two mines on the Witwatersrand where the successful treatment of tailings by the direct-filling process was being carried on—the Jumpers G. M. Co. and the New Kleinfontein Co., Ltd. The following is a short description of the plant and method of treatment adopted at the latter mine during six months:

The plant consisted of two slime separators, nineteen treatment vats, four extraction boxes and nine solution tanks; the slime separators were of the ordinary spitzkasten or pointed box style, 6 feet square at the top, 6 feet deep. Of the nineteen treatment vats, thirteen were of 200 tons capacity, and six of 130 tons capacity each. Around the top of each vat was a launder, which carried away the overflow into the slimes race. The nine solution tanks had a total capacity of 636 tons of solution, and each was connected with the three centrifugal pumps worked from a motor that pumped the weak, medium or strong solutions onto the treatment vats. The pulp or tailings, after leaving the battery plates, was lifted by means of a tailings wheel into a launder, by which it was conveyed to the slime separators. The slimes from the first separator passed into the second, whereby a quantity of fine sand was saved that otherwise would flow away. About 15% of slimes were eliminated in the separators, and the remaining pulp run through launders into the treatment vats, which were previously filled with water. In the course of filling the vat, another 10% of slimes overflowed into the slimes race, so that the resulting tailings to be treated in the vat contained but a small proportion of slimes.

The vat was filled with tailings (sand) to within 1 foot of the top, when the stream was diverted into another vat.

The following table is a page from the logbook of the New Kleinfontein Co.'s cyanide works, which shows the exact method of procedure adopted at the works in the treatment of a vat of tailings:

| VAT I. CHARGE I. CAPACITY 207 TONS. |         |        |                                                                            |               |

Amount of KCy used, 5.9 pounds per ton.

METHOD OF TREATMENT.—Each vat, after being drained of water, was treated with an alkaline so-

lution to neutralize the free acid in the tailings formed by the decomposition of pyritic ores. As soon as the solution draining away was slightly alkaline, the treatment by cyanide solution was commenced. Various strengths of solution were pumped into the vat, each vat receiving during its course of treatment from 200 to 275 tons of cyanide solution. The length of treatment was six days and the amount of cyanide used 0.6 pound per ton of tailings.

PRECIPITATION OF GOLD IN THE EXTRACTOR BOXES.—The precipitation of gold from the solution coming from the treatment vats was effected by means of zinc shavings. A certain portion of the ore coming from the mine was of a rebellious nature, containing sufficient foreign metals to retard, if not prevent, the precipitation of gold by zinc. To counteract the effects of these foreign metals it was proved efficient in practice to set up a lead couple, and at these works this was effected by dipping the zinc shavings in a weak solution of acetate of lead, preparatory to being placed in the extractor boxes. In all cases it was found that zinc containing from 1% to 2% of lead gave the most satisfactory precipitation. By the use of acetate of lead a perfect precipitation was brought about, only traces of gold remaining in the solution after passing through the extractor boxes.

The zinc shavings were first placed in the zinc solution box, and afterwards transferred to the medium and thence to the strong. In the weak and medium solution precipitating boxes, the gold became plated on the zinc, and less zinc was destroyed than in the strong. The solution from the extractor boxes, containing only traces of gold, was returned to the solution tanks, where, if found necessary, its strength was made up by the addition of cyanide.

CLEAN-UP AND REDUCTION OF ZINC-GOLD PRECIPITATES.—The zinc was taken from the boxes at the semi-monthly clean-up, and washed by hand in an oblong wooden box; the washings then placed on a screen of 700-mesh, when all that would not pass the screen were replaced in the extraction boxes, together with the washed zinc. The product that passed the screens, consisting of gold in the state of a black slime and fine particles of zinc, was placed in a vat containing a filter bottom consisting of duck canvas placed over a wooden grating. This space beneath the filter bed was connected with a 2-inch pump, by means of which the excess of moisture in the slimes was drawn off through the filter bed, the solution thus drawn off being passed into one of the extraction boxes to prevent loss of very fine particles.

The slimes freed from excess of water were taken out and placed in another vat, having a capacity of about five tons; a 10% solution of sulphuric acid is gradually added, the whole mass being continuously agitated by means of a mechanical agitator.

The acid dissolved the zinc, and when the solution was accomplished and no more action took place the vat was filled with water, the agitator being kept stirring all the time. When the vat was full of water the agitator was withdrawn and the slimes allowed to settle for an hour. The water was then decanted off, the slimes taken out, dried and roasted in a furnace, care being taken that the slimes were not disturbed during the roasting so as to cause any loss.

The dried slimes before any acid treatment contained 4% of gold; after treatment this percentage was increased to 33% or 45%. The average fineness of bullion recovered was 847 gold and 60 silver, the base metals being principally copper and lead.

Of the pulp leaving the mill, 73% was recovered and treated in the cyanide works, and an actual extraction of 80% of gold was recovered from this, or 60% of the gold leaving the plates.

Among the advantages gained by the use of the direct-filling process was the smaller plant required. The cost of erecting eight settling vats, of 450 tons capacity each, including foundations, trucks, filter beds and piping, would be \$30,000.

Interest on \$30,000, at 10%..... \$3,000  
Maintenance of settlers for twelve months, 10%... 3,000  
Two extra shifts men in works, at \$110 per month. 2,640  
Discharging 192,000 tons of tailings, at 8c. per ton. 16,000

Total.....\$24,640

This is equal to a profit of 12 cents per ton, or 2% of the capital of the company, the actual working cost being 48 cents per ton, including general charges and maintenance.

THE Bethlehem Iron Company, South Bethlehem, Pa., in 1890 erected the largest steam hammer ever built, having a capacity of 125 tons falling weight. This was operated successfully for three years in the manufacture of armor plate, but when, 1893, a new type of this product was invented by H. A. Harvey, it was found that the hydraulic press was better adapted for its manufacture, and this enormous tool, which, with all its accessories, cost in round figures a quarter of a million dollars, was immediately set aside, to be replaced at a similar cost by a hydraulic press, which to-day still remains the largest in the world. This is probably the most notable instance on record, on account of the great expense involved, of the substitution of a more efficient tool for another, the normal life of which had only just begun.—Engineering Magazine.

## Box Sluices.

A box sluice is constructed of rough boards 1½ inches thick and 12, 14 or 16 feet long. The bottom boards are sawn 4 inches wider at one end than at the other, so that the narrow end of one box telescopes into the broad end of the next, throughout the series; and, beyond this fixing, no nailing or fastening is required. The maximum width of this box is never less than 1 foot nor more than 5 feet, but is generally 16 to 18 inches, while the sides are 8 to 10 inches high. The line of troughs rest on trestles, and is so arranged that there is a descent, incline, or grade throughout the series. It is important that the sluice should be conveniently near the level of the ground, where the pay-dirt is shoveled in; and this consideration, therefore, has often a bearing on the choice of grade.

The length of the sluice varies with the consistency of the gravel, the fineness of the gold, the cost of the sluices, and the fall of the ground. It must be sufficient to complete disintegration and to save the gold. The length and grade necessary for these purposes may be adjusted by experiment. If, in the clean up, the lowest boxes yield much gold, an addition to their number is necessary; while, if they yield none, the length of the sluice may be shortened. The shorter the sluice the lighter the grade should be, as a high grade and rapid flow entail greater risk of the fine gold being lost. The grade of a sluice is measured by inches per box, or by the fall per hundred units of lengths, or in terms of the slope; thus a grade of 12 inches means a fall of 12 inches in a 12-foot box, unless otherwise stated, or the same grade may be expressed as 8.3%, or a slope of 1 in 12. For box sluices the grade is seldom less than 8 inches or more than 20 inches per 12-foot box. Box sluices can be fitted with riffles, false bottoms, drops, undercurrents, etc.

The amount of material washed is limited chiefly by the capacity of the men throwing in the pay dirt. When the height of lift is 4½ to 5 feet, 24 cubic yards will be a good day's work for four men, or, say, 6 cubic yards per man.

In some places, where for the most part the slope of the valleys is very gradual and the grade has consequently to be obtained by elevating the boxes on trestles, the sluices are necessarily short and usually under 100 feet. This has led to the development of a special type of sluice used for washing light sand. The sluice used in Siberia is thus described by Dr. Rose in his Metallurgy of Gold: The apparatus at Volchanka, which may be taken as a type, consists of a head sluice and three secondary sluices, which, placed at right angles to the head sluice, leave it at different points and converge to a common center where the tailings are discharged. The head sluice begins at a height of 13 feet above the ground; it is about 90 feet long by 2 feet wide, and has a fall of about 1 in 14. The sands are dumped from wagons and shoveled into the sluice. After passing through a grizzly the gravel runs over a series of cast-iron cross bar riffles, which form a number of rectangular depressions—pigeon holes—in the sluice bed, by which disintegration is favored. The stream then flows over an iron grating, through which a part of it falls into the first secondary sluice, while the remainder continues its course over more pigeon-hole riffles. A second and a third screen open on to the other secondary sluices; and such of the gravel, chiefly small stones, as has not passed through the gratings is let fall into a hopper, and removed to the dumping ground. The secondary sluices (resembling the Californian undercurrents) are wider than the head sluice and have a steeper grade. The sands first pass over a number of transverse riffles, and then over about 30 feet of blanketing, the sluice being widened at the same time, and subdivided by longitudinal wooden partitions, and the grade being as much as 1 in 6, while small drops are introduced at intervals of a few feet. The third sluice has a more gentle inclination than the others. The tailings fall into a sump, are lifted by a bucket elevator into a hopper, and thence removed to the dumping ground. No mercury is used in the sluices, but the gray concentrates, or black sands, are treated with mercury in the Siberian trough, or on inclined tables. The output is about 500 tons of gravel per day of 13½ hours, the labor being furnished by twenty men and ten horses. The gravel contains from 12 to 15 grains of gold per ton. The gold, scales and plates, is chiefly found in the head sluice, where 70% is caught, 30% being caught in the secondary sluices. At Tchernai-Retchka, however, where the gold is less finely divided, 97% was caught on the head sluice, and only 3% on the secondary sluices. The amount of water used at Volchanka is about six times the weight of the gravel. The cost of construction of the works was 70,000 roubles, or about \$34,000.

A MAN who advertises only once in a while does not get the full value of his advertising. Neither he nor his business ever benefits from the cumulative value of publicity. His each announcement may bear some fruit in proportion to its individual value, but one absorbs nothing of the good wrought by the other. His firm name is not kept constantly before the people. It is not unremittently impressed upon consumers. Hence he is in a measure a new advertiser every time he advertises.

**Mining and Metallurgical Patents.**

**Patents Issued February 19, 1901.**

Specially Prepared for the MINING AND SCIENTIFIC PRESS

**AMALGAMATOR.**—No. 668,282; C. G. Collins, Woodmere, New York.

In amalgamating apparatus for continuously producing sodium amalgam and amalgamating ores under hydrostatic pressure, combination of stationary amalgamating tank A, adapted to contain mercury, rotatable stand pipe B, provided with perforated disks D, D', cathode N, situated below end of supply pipe B, pipe E, opening into amalgamating tank A, in proximity to cathode N, considerably below mercury level, whereby ore introduced into mercury through pipe B is subjected to hydrostatic pressure, vessel F, connected with pipe E, above level of mercury in amalgamating tank A, and anode P, situated in vessel F, whereby continuous supply of sodium amalgam is formed at surface of mercury in pipe E, and diffused through mercury in tank A, by hydrostatic pressure and agitation thereof caused by submerging feed B and rotation of disks D, D'.

**MINER'S CANDLESTICK.**—No. 668,317; G. T. Parsley, Hornbrook, Cal.

Combination in miner's candlestick of handle having parallel extensions, pointed arm and hanging hook having split ends, pivots by which they are turnably held between extension sides, lugs and notches whereby they are locked in operative position, bent arm projecting from one of the extension sides, thimble or holder for candle consisting of cylindrical elastic strip having elastic tongue through which pivot pin passes.

**HYDRAULIC DREDGING APPLIANCE.**—No. 668,342; E. Risley, Pleasantville, N. J.

Hydraulic dredging apparatus provided with means for indicating choking of pipes, means consisting of pivoted blade within piping of dredging apparatus, dial and pointer indicating device outside piping connected to pivoted blade.

**GOLD WASHING MACHINE.**—No. 668,371; L. Franklin and J. Tonnar, Anaconda, Mont.

Machine for washing gold, comprising stationary base frame, rocking frame mounted thereon, provided with downwardly and backwardly directed chute forming part of apparatus mounted on frame for washing and separating gold, water wheel connected with rear end of base frame adapted to receive discharge from chute, shaft of which is provided at each end with crank, crank rod connected with each crank at opposite sides of machine, toggle levers connected with base frame and rocking frame, movement of wheel utilized for operating rocking frame.

**CONVEYOR.**—No. 668,378; M. Korth and W. Garity, Franklin Furnace, N. J.

Apparatus comprising chute, chains movable along opposite sides of chute, cross arms clamped to chains, bent at center to approximately fit chute, guides at opposite sides of chute, rollers carried by cross arms engaging under sides of guides, buckets on cross arms to fit chute.

**CROSS HEAD FOR MINE SHAFTS.**—No. 668,464; J. T. Semmens, Bald Mountain, Colo.

Combination with hoisting cable and head thereon, of cross head, of locking bars mounted to slide on cross head and adapted to engage cable head, spring-pressed levers fulcrumed on cross head, connected with locking bars, stops adapted to be engaged by levers at time cross head reaches lowermost position in mine shaft.

**AMALGAM SQUEEZING MACHINE.**—No. 668,488; J. V. Coleman, San Francisco, Cal.

Machine for squeezing amalgam, comprising oppositely set standards, shafts supported in standards in horizontal position in line with each other, having gripping jaws on their adjacent ends, means for rotating and feeding forward shaft, means for regulating forward feed with respect to rotary motion.

**PROCESS OF MAKING TUNGSTATES.**—No. 667,705; G. T. Holloway and H. W. Lake, London, England.

Extraction of tungsten compounds from tungsten ores, adding the ore in finely divided state to fused bath of silicate of alkaline metal, capable of combining freely with iron and manganese or lime in ore, whereby practically pure tungstate of alkaline metal is produced at one operation.

**TRIPOD FOR ROCK DRILLS.**—No. 668,493; J. J. Crippen, Denver, Colo.

Tripod for rock drills, comprising U-shaped horizontal frame having ends facing forwardly, provided with bearings, depending brackets, formed at central rear portion with guide slot, tilting head having journals mounted in frame, locking member movable in slot, locking means on rear portion of frame to engage locking member and hold head in adjusted position, legs pivoted to depending brackets, each having adjustable bipartite coupling, legs mounted to swing forwardly and laterally of frame.

**STAMP MILL.**—No. 668,578; G. L. Gibson, Denver, Colo.

Combination with suitable framework, series of circularly disposed stamps having their stems vertically guided in framework, means for raising and dropping stamps, annular feed trough communicating with annular mortar, in which stamps operate, suitable ore hopper, rotating feed spout communicating at upper end with hopper, at lower end with feed spout, partial annular cover adapted to close any desired portion of feed trough, lower end of feed spout adapted to move over partial cover to be closed thereby, whereby flow of ore to portion of annular mortar corresponding to closed feed trough section may be interrupted, such portion of mortar temporarily inoperative.

**MINING DRILL FOR COAL OR ROCK.**—No. 668,593; A. Walker, Whatcheer, Iowa.

In mining drill combination with boxing of two hinged sections and annular groove formed in inner face, lining therefor having peripheral rib to prevent longitudinal displacement thereof, pair of studs formed integral with inner face of lining, adjustable wear block arranged in boxing, of twisted auger operating through lining and engaging studs, auger having each twist adjacent to drill end cut away in segmental manner, flattening one side thereof, bevel gear, means for operating gear.

As there is practically no limit to the mineral wealth of this country, there can be no bounds set to the prosperous activity based on that wealth. In agriculture a bad season or stagnant market brings disaster; the best mercantile business is constantly menaced by competition; manufacturers are keenly sensitive to market fluctuations, economic conditions and financial temper, while the gold of the mountains is eternal with wealth that carries no fluctuating value, the gaining of which enriches all and robs none save nature. Nature's bank has stood since the world stood; no run on it has ever shaken it; the crash of falling empires leaves it undisturbed, and it always pays rich dividends to those fortunate enough to hold shares in its bank.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

Late reports from Rampart state that a big strike is made on the Kuskokwim river, south of that place, and that a stampede to the new find is being made from Nome and other points.—Chief Clerk Hathaway of the U. S. Assay Office, at Seattle, estimates the output of Nome region for 1901 from \$8,000,000 to \$10,000,000.—The Nowell Co., operating at Berners Bay, near Juneau, has borrowed \$150,000 in New York, with which it will pay off its indebtedness.

It is reported that M. J. Heney, who built the White Pass & Yukon Railroad, will build a line from Valdez to Circle City, a distance of 140 miles.—It is said that as high as \$80 a day were rocked out last season on Gold bench, on the south fork of the Koyukuk.

### ARIZONA.

#### GILA COUNTY.

Work is resumed on the United Globe mines at Globe under Supt. N. S. Berray. Fifty men are employed. A new shaft is being sunk on the Gray claim, 420 feet south and a little west of the old shaft. It will be a three-compartment shaft—two compartments each being 4x4½ feet and one 5x4½ feet. Machinery from the old Hoosier shaft will go in at the new shaft.—Machinery for the Black Copper, near Globe, is going in.—Work is resumed on the Continental, of the Old Dominion properties.

#### GRAHAM COUNTY.

A 10-stamp mill will be put in at the Homestake group, on the San Francisco river, near Clifton.

#### MARICOPA COUNTY.

The second payment of \$1 per share, or \$65,000, on the Cobre Grande at Phoenix is made by W. C. Greene, president Greene Con. M. Co., at Phoenix.—The Lime Creek Copper Co. has begun operations on its property near Phoenix.

#### MOHAVE COUNTY.

At the Boulevard, near Kingman, a new hoisting plant is to go in.—The Schuykill Co. will put in a concentrating plant at Chloride.—All working mines and mills near Chloride are preparing to use oil as fuel. A 10,000-gallon tank is in at Kingman, and oil is ordered from California.

#### PIMA COUNTY.

The Darius Green M. Co. is pushing work on its properties near Tucson.

#### YAVAPAI COUNTY.

The McCabe mine, which had been closed down several months, has resumed and is shipping a carload of ore per day. The production amounts to a larger tonnage than this, for the milling ore is being allowed to accumulate at the mine. The smelting ore being shipped runs from \$60 to \$80 per ton, the values being gold, silver and copper, the last named running about 4%. These values are carried in a copper and iron sulphide. A new mill may be erected this season. Judge Wells, the manager, states that it has not yet been decided whether it were better to use stamps or crushers and rolls for the McCabe mill ores. The main point is to get good results from concentration. The McCabe shaft is 700 feet deep, the main ore production coming from the 500 and 600 levels. WASCOTT.

McCabe, Feb. 16, 1901.

A new body of ore, running \$25 gold and fifty ounces silver to the ton, is opened up in the Bryan, near Prescott.—An additional 100 feet will be sunk in the shaft of the Golden Fleece, same locality.—A new mill is to go in on the Mud Hole mine, near Prescott.—An option is given on the Lincoln group, near the Crowned King, Prescott. A 20-ton mill will go in if the deal goes through.

#### YUMA COUNTY.

The production of the La Fortuna, near Yuma, for 1900 is given as \$1,386,000 in gold.

### CALIFORNIA.

#### AMADOR COUNTY.

The shafts on the Wildman-Mahoney, at Sutter Creek, are down 1300 and 1000 feet, respectively.—The shaft on the Lincoln, same locality, is down 1260 feet; on the 500-foot level a crosscut is run east and west about 200 feet north of the shaft.—Operations at the Balliol, 1 mile east of Sutter Creek, are under way; Supt. W. H. Storms.—The shaft on the Potazuba, 1½ miles east of Sutter Creek, is down over 500 feet; levels are run at 100, 200 and 350 feet.—Two tunnels on the Treadwell, of the Treadwell-Guilana, 8 miles east of Sutter Creek, are respectively 700 feet and 300 feet long; mine is idle.—Operations on the Eureka, at Sutter Creek, are

progressing satisfactorily under Supt. W. R. Thomas.

The suit of the East Central Eureka M. Co. against the Central Eureka M. Co. is transferred to this county for trial. The plaintiff alleges that the other company had been taking ore from its mine, the property of the two being adjacent.

#### BUTTE COUNTY.

Water is struck at 260 feet in the tunnel in the Bloomer Hill, near Berry creek.—J. Marks is working the Cortez, near Enterprise.

#### CALAVERAS COUNTY.

The Alpine and Pajaro, near Washington Ranch, are bonded to E. C. Rigley and others for \$20,000.—The main shaft on the Birdena, at Campo Seco, will be sunk an additional 100 feet.—The Mead G. M. Co. will sink a shaft on one of its properties near Rich gulch.—The Anglo-Saxon M. Co. is pushing work on its property near Rich gulch.—At Columbia, a \$3000 pocket was recently found on the Bald mountain.—The Union mill, near Binum's, is being moved to the Sugar Pine, near Murphys.—Drifting is in progress at the Buffalo, in Chili gulch, near Mokelumne Hill.—At the Melones, Robinson's Ferry, a raise is being run to connect main tunnel with upper workings; vein on property is reported 60 feet wide; ore is said to mill \$4 per ton.

#### EL DORADO COUNTY.

Work will begin on the Gold Hill, near Bear creek.—The mill at the Hart, below Georgetown, is running steadily.—The Alhambra, in Kelsey district, is being opened up by J. Sipp of Auburn.—Operations on the Shaw, at El Dorado, are under way.—Operations at the Murray, at Pleasant valley, are under way.

#### HUMBOLDT COUNTY.

The Forks and Bloemer claims, near Forks of Salmon, are being worked by Manager Bennet.—Manager F. Gent will replace machinery at the Nordheimer, near Forks of Salmon.

#### INYO COUNTY.

A recent cleanup of Barnes & Anderson, operating east of Independence, returned \$2300.

#### KERN COUNTY.

The Kinyon mill, at Randsburg, is running on ore from the Little Butte, near there, operated by Hammell, Graham & Lamb.—The Jennie B. group, near Slate Range, will be incorporated and developed on an extensive scale.—The Prosperity Oil Co., capital \$1,000,000, and the Morning Star Oil Co., capital \$100,000, are incorporated at Bakersfield.—Good progress is being made on the new mill at Randsburg.—The Yellow Aster mill, Randsburg, closed down for a few days last week, owing to a lack of fuel.—The Gray Gander Oil Co. is putting up its derrick No. 2, near Bakersfield.—The well of the Potts Oil Co., at Sunset, is down 950 feet.—The U. S. Oil Co., at Sunset, is down 460 feet.—A new rig is going up on 19, 29-23, owned by the Bolena Oil Co.—The Lone Star Oil Co. has resumed drilling on 32, 12-23, near Bakersfield.—The Western Union Oil & Development Co., capital \$1,000,000, is incorporated at Bakersfield.—The Dabney Oil Co., owning and operating 110 acres of land near McKittrick, has completed ten wells, and is sinking three more. The company has eight drilling rigs with which it expects to complete, on an average, two wells per month. Oil is 20 gravity, and tests show 55% illuminant, besides asphalt of good quality. Present wells are 2000 feet from the railroad, where the company has three storage tanks, a fall of 200 feet giving sufficient pressure to load cars.—The Eclipse Oil Co. has two rigs in operation at McKittrick.

#### LOS ANGELES COUNTY.

At Los Angeles the Nueva Camulos Oil Co. has completed its third well and is drilling No. 4.—Lowe & Williams are drilling their third well east of Western avenue.—The Southland Oil Co. is drilling its first well.—Progress is being made by the Congress Oil & Pipe Line Co. in drilling its well near Los Angeles; oil is lighter than when first struck.—The Lacey Oil Co. has completed its first well.—The Crown Petroleum Oil Co. is drilling two new wells on Toluca and Colton streets, Los Angeles.

#### MADERA COUNTY.

The Spangle G. M. Co., operating 8 miles from Raymond, will put in new machinery.—The mill at the Rex, at Grub Gulch, is crushing ore from that mine.—The Enterprise, near Raymond, will resume.

#### MONTEREY COUNTY.

Drilling for oil is in progress near San Ardo.

#### MONO COUNTY.

At the Standard Con. mill, Bodie, for the week ending Feb. 16, 375 tons of ore were crushed; average assay tailings, \$4.95; concentrates produced, 1.02 tons; assay

value, \$134.61; amalgam produced, 1208 ounces; assay value per ounce, \$2.29.

#### NAPA COUNTY.

Gold ore running \$2.54 to the ton is reported opened up on Howell mountain, near Fine Crest, 6 miles from St. Helena.

#### NEVADA COUNTY.

The Hudson mine, below Rough and Ready, may soon have an extensive new plant of heavier machinery than that now in use.

The Yuba Con. M. Co., Supt. Bryson, is unwatering the Yuba, at Maybert.

The Tule Belle M. Co., operating on Cincinnati Hill, near Grass Valley, has levied an assessment of 2 cents per share, to sink the shaft an additional 100 feet.

A new hoisting plant will go in on the Posey, at Willow Valley.—The Silver Creek Land & Dev. Co., capital \$600,000, is incorporated at Nevada City.

C. L. Loughridge, representing Eastern men, will examine the German, near Ormonde, which has lain idle for some years; should his report be favorable, the property will be bought and developed.

Operations at the Lecompton, near Nevada City, have resumed.—A new 10-stamp mill for the Campbell, near Nevada City, Supt. J. C. Campbell, will go in.—The Bitner, at Spenceville, is bonded to Mr. Campbell of Nevada City and San Francisco men.—A strike of good ore is reported made at the 400-foot mark in the old Cambridge tunnel of the Gold Blossom, on Union Hill, near Grass Valley.—A 4-stamp mill will go in on the Golden Treasure, near Grass Valley; G. R. Tuttle, owner.—Operations at the Conlan, Grass Valley, are suspended, owing to flooding of the mine; as soon as unwatered, operations will resume; Supt. O'Connor.

#### ORANGE COUNTY.

Well No. 21 of the Santa Fe Oil Co. at Fullerton is flowing. Ten per cent of the output is a light grade oil, the remainder being water. The company is drilling well No. 24 and a rig is going up to drill well No. 25.

#### PLUMAS COUNTY.

The Clay Bank, near La Porte, has resumed operations.

#### RIVERSIDE COUNTY.

Work is resumed on the well of the San Jacinto Oil Co. at Moreno.

#### SACRAMENTO COUNTY.

The Ashburton M. Co. will put in new and heavier buckets at its dredger near Folsom. Operations will resume in June.

#### SAN BERNARDINO COUNTY.

A strike of gold and copper ore, running from 16% to 26% copper and from \$40 to \$60 per ton, is reported made on the Boner properties, 60 miles south of Needles.—A three-fourths interest in 380 acres of mineral land near Ontario is reported sold to D. E. Hayes of San Francisco for \$50,000.

#### SAN DIEGO COUNTY.

The Victoria Oil Co. at Encinitas has resumed operations.—The well on the Monarch is down 1200 feet.

#### SHASTA COUNTY.

Work on the buildings, etc., of the new smelter for the Bully Hill mines, near De Lamar, is going ahead.—The Mt. Shasta Oil Co. has begun drilling for oil in Sand Flat, near Redding.

#### SIERRA COUNTY.

The Rising Sun, at the mouth of Slug canyon, near Downville, is sold to J. W. Finney.—Brock, Budd, Godfrey & Jones have bought interests in and have bonded the remaining interests in the Swansea, Bush, Mammoth and Yankee placer claims at Chippis Flat. A company is formed to work the properties; J. Brock, manager.

#### SISKIYOU COUNTY.

The China M. Co., operating on Greenhorn, near Yreka, has its steam hoisting plants running steadily.—Operations are under way night and day at the Cardoza, same locality.—The Helen mines, at Patterson creek, will be opened again by Oakland men.—The Sheba M. Co. will rebuild its mill and other buildings recently demolished by a snowslide.—Splengler Bros. are pushing operations at the mouth of Humboldt, near Yreka.—Miners at Oro Fino, Quartz Valley and Mugginsville are preparing for a steady run.—The Downing, Henley district, is incorporated; a mill will go in, and work will be pushed.—Operations are under way at the Jillson, same district.—A mill will probably go in on the Wolverine, same district.—The La Fless is running steadily.—At Gazelle, the new mill is nearly completed.—The Siskiyou Hydraulic mine, near Callahans, will resume operations.—A body of copper ore is opened up in the 100-foot tunnel of the Lythe, near Callahans.—The Van Brunt, near Happy Camp, is running steadily.—Operations at the Gordon, same locality, are being pushed; superintendent and owner, Gordon.—Martin & Bailey are working the old Fort Goff,

near Fort Goff, with 2000 inches of water.—Ten men are employed at the Portuguese, above Fort Goff, in the Selad district, and work is being pushed by Supt. Gilbert.—The 10-stamp mill at the Cherry Hill, on Cherry creek, near Yreka, is being overhauled and repaired.—Fernandez & Co. are getting their hydraulic mine on Cherry creek, in shape for a run; the company expects to clean up \$25,000 this season.

#### TUOLUMNE COUNTY.

The ditch of the Yosemite G. M. Co., near Hamilton, is damaged by recent storms, one piece of flume 500 feet long and 50 feet high being carried away.—At the Mazepa, near Sonora, drifting is in progress on the 500-foot level; Supt. Moore.—A strike of rich ore is reported made on the 700-foot level of the Jumper.—The Green, near Sugar Pine, is running.—At the Black Oak, Sonora, the 80-light dynamo is running steadily.—A new 10-stamp mill will go in on the Republican, Sonora.—Herndon & Byrn are working the Ophir, at Deer Flat.—The Little Wonder, at Big Oak Flat, is being unwatered; Supt. Roberts.—Operations at the Starr King, near Carters, are closed down temporarily, owing to lack of wood.—Drifting is in progress on the 400-foot level of the Dreisam.

The Dead Horse, near Sonora, is in operation again.—A shoot of good ore is reported in the Mayflower, same locality; T. C. Winwood, Supt.—A new bed for the air compressor at the Grizzly will go in.—The Star King mill, Sonora, is running.—At the Draper, same place, sinking is progressing; most of the machinery for the new mill is on the ground; general manager, F. E. Houghton.—Operations on the Tanzy, near Sonora, are under way.—The San Justo, on Carson creek, near Sonora, will be abandoned, owing to influx of water caused by striking an old shaft in bed of the creek.—The Big Seven M. Co. is granted judgment for \$600 against W. B. Clement by the Superior Court at Sonora.

#### VENTURA COUNTY.

Six thousand acres of alleged oil lands near Santa Paula are reported sold to McKelvey and others for \$150,000.

### COLORADO.

#### BOULDER COUNTY.

The B. & M., at Ward, is making regular weekly shipments of smelting ore; the main shaft, now down over 800 feet, will go to a depth of over 1000 feet. Denver parties have bonded the Fox Hound, near Ward; the contract calls for twenty shifts per month.—At Sunshine the Penago M. & R. Co. will put in a new 50 H. P. boiler.—The India M. Co., capital \$1,500,000, recently incorporated at Boulder to work the India at Magnolia; a new plant will go in.—Karf & Bruner, operating on thirty acres land, on South Spencer mountain, at Eldora, recently opened up ore running \$16 gold to the ton.—Work is resumed on the Norway, at Eldora.—Eighty-dollar ore is reported opened up on the Lady Grace.—High-grade ore is opened up in the 200-foot level of the Revenge, at Eldora.—The shaft on the B. & M., at Ward, now down 800 feet, will go to the 1000-foot level.—The Wall Street Gold Extraction Co. will erect a 100-ton electro-chlorination plant at Wall Street.

#### CHAFFEE COUNTY.

The New Year, at Granite, is temporarily closed down.—Work is in progress on the Columbine, at the head of Lost canyon, near Granite.—At Chalk creek the Latchaw M. T. & M. Co. will probably put in an electrical hoisting plant on its property on Raspberry mountain; an air compressor and drills are now going in at the company's tunnel.

The vein on the Mary Murphy at St. Elmo runs in places from 20 to 30 feet in width. The mine is equipped with tram, compressor and air drills.—The Pioneer and Mollie mines, St. Elmo, have run 750 tons of ore through the Pawnee mill.—The Red Raven Con. M. Co. of Marietta, Ohio, will extend its crosscut tunnel on the Red Raven, near Hancock. The tunnel is now in 200 feet.

#### CLEAR CREEK COUNTY.

The Senator, near Dumont, will resume operations.—Fifteen new stamps will go in at the Kokomo Pioneer Co.'s mill, at Idaho Springs.—The shaft on the Minot is down 400 feet; high-grade ore is running about \$100 to the ton.—A recent shipment of ore from the Santiago, at Argentine Pass, milled 4½ ounces gold, 12 ounces silver and 15% lead to the ton.

A strike of rich ore is reported in the upraise from the tunnel level of the Griffith No. 1, on Griffith mountain, near Georgetown. The vein is 18 inches wide and the ore assays 25% lead, 136 ounces silver, 6% copper, with a little gold, to the ton.

#### EAGLE COUNTY.

A 35 H. P. engine will go in on the May

Flower, near Grand river; the incline, now down 1500 feet, will be continued.

## GILPIN COUNTY.

The new 100 H. P. double engine hoisting plant of the Gregory-Buell Con. M. & M. Co., at Central City, is placed on its foundation, latter being 20x20 feet and built of solid masonry.—The Pain Killer, Black Hawk, after lying idle thirty years, is being operated by Shear, Snedaker & Giroux.

## GUNNISON COUNTY.

Good ore is opened up in the 140-foot shaft on the Dillen group, 6 miles south of Gunnison.—A vein of good copper ore is opened up in the Hoffman tunnel, on Crystal mountain, near Gunnison.—Work is in progress on the A. E. Reynolds property, near Pitkin.—The Silver Basin shaft, now down 200 feet, will be continued an additional 300 feet.

## HUERFANO COUNTY.

Assays of ore from property near La Veta, owned and operated by A. H. Edmiston, of same place, give 24.8% copper and three ounces silver to the ton.

A second power drill goes in at the Eagle Plume, near Walsenburg; Supt. Murry.—A strike is reported made on the Oregon, in North Arastra gulch, near Walsenburg, owned and operated by Houck, Martin & Fullenwider. A shaft is being sunk and ore will be treated at the Clayton mills.—G. Hurd, operating in Block gulch, near Walsenburg, is driving a tunnel. A ledge 12 feet wide was recently opened up at a depth of 200 feet.—Work is going ahead at the Utopia, same locality.

## LAKE COUNTY.

The greater part of the zinc mined in and around Leadville is shipped to Vieille Montague, a strip of neutral territory between France and Germany, where zinc mining has been carried on for centuries.—The Wad Waldo M. Co., which recently bought the Eclipse, near the Little Johnny, Leadville, is sinking a shaft on the property to the 900-foot level; F. C. Rantchler, manager.—A strike is reported made in the Bison, at the head of East Fourth street, Leadville; G. F. Canipion, manager.

## OURAY COUNTY.

The Calliope-Dexter, near Ouray, is reported sold to H. Schumacher and J. A. Arbogast, of Chicago, Ill., for \$220,000; a 40-stamp mill will be put in shortly, and other improvements made; sixty men will be employed; contract calls for work to begin by June 1st.—Work on the Governor, in Sneffels district, is progressing; a shipment of ore will be made April 1st.

## PARK COUNTY.

Work is begun on the ditch of the Cincinnati Placer Co., at Alma.—Ore running \$50 to the ton is reported in the Smith-Orphan, Alma.—The Wheeler, at Alma, is reported sold for \$50,000.

## SAN JUAN COUNTY.

A strike of 4 feet of good ore is reported in the Esmeralda in Minnie gulch, near Silverton.—Denver men have bought the Crown Prince and Liverpool claims in Prospect basin, near Silverton.—An electric drilling plant will go in at the Henrietta, near Silverton.

## SAN MIGUEL COUNTY.

The old mill at the Smuggler, near Telluride, will have ten additional stamps.—The tunnel in the Pennsylvania is now in 3000 feet.—The Liberty Bell is turning out about 300 tons of ore per day. About 190 men are employed.—The new 2000 H. P. power station at Vance Junction is running successfully. Power is being supplied to ten mills.

## SAGUACHE COUNTY.

The Banner M. & M. Co. of Philadelphia, Pa., has bought three claims north of Crestone townsite for \$20,000. A 1600-foot tunnel is being driven. Picked samples of ore assay from \$40 to \$500 per ton.

## SUMMIT COUNTY.

The main drift on the Scepter and Tom Corwin mines, on Democrat mountain, near Georgetown, is in 2000 feet. A cross-cut is being run at the 1440-foot mark to cut the Astor lode at a depth of 800 feet below the lowest level. Work on the new tramway and ore bins is in progress. The bins will have a capacity of 600 tons. Thirty-five men are now employed. Another short tram will go in later on. A concentrating mill with a daily capacity of 100 tons will be built immediately; Red Oak M. Co. operators.

## TELLER COUNTY.

The total effective compressor power at the Independence, Victor, will operate seventy drills, the new 30-drill compressor now being in place. The shaft, now down 900 feet, will go to the 1500-foot level.—A strike is made in the west crosscut on the 100-foot level of the Arno, on Anacanda townsite, near Cripple Creek. The ore runs \$30 to the ton.—Two 1000-gal-

lon tanks are attached to the cage in the Elkton at Cripple Creek, to take water out of the two lowest levels. It is estimated that there is enough ore in and above the 600-foot level to keep operations going.

Senator E. O. Wolcott has an ore body in his mine, the Last Dollar, 14 feet between the walls. The foot wall is granite, the hanging wall phonolite, which for 15 inches carries a value of from one and a half to three ounces gold.—Returns from the first shipment of ore made from the recent strike on the 350-foot level of the Columbia at Cripple Creek show that the ore ran \$50 to the ton.—The Buffalo & Cripple Creek Tunnel Co. will sink a 500-foot winze from the north lateral of the main tunnel of the Orizaba. The winze will be 5x9 feet in the clear. When completed the bottom of the winze will be 800 feet below the surface. The main tunnel is now in 1100 feet. An 800-foot lateral is driven north at the 1000-foot mark. The tunnel is double-tracked and equipped with an air compressor.

## IDAHO.

## ELMORE COUNTY.

The Baltimore, near Atlanta, is being operated by Lynch, Olsen & Scholl. The ore runs \$65 to the ton.—Operations on the Tahoma, same locality, are under way. In No. 1 and No. 2 tunnels a good body of ore is blocked out.—The Golden Nugget is now being operated by S. H. Walby. The ore runs about \$11 gold to the ton.—Frankie, Lange & Lape Bros., operating the Dewey, near Atlanta, have spent \$10,000 upon the property. A 5-stamp mill was put in some time ago.—Work on the Webfoot is under way and ore being piled up for milling in the spring.—The Jessie Benton and Moultrie claims are being worked by N. Drake. The ore runs \$50 to the ton.

## SEOSHONE COUNTY.

The tunnel is being run on the Mammoth, near Wallace, to cut the ledge.—Below Gem, the tunnel on the West Bell will cut the ledge by May 1.—The second tunnel now being run on the Humming Bird, near Wallace, will cut the ledge 225 feet below the point where a strike was recently made.—Near Burke, the crosscut tunnel on the Sonora is 1250 feet long; drifting is in progress.—The Kincanno mine and 10-stamp mill, 6 miles east of Murray, are sold at Sheriff's sale to R. R. & F. B. Steen for \$4517, latter being amount of judgment and costs awarded in their case against the Granite G. M. Co.

## MICHIGAN.

## HOUGHTON COUNTY.

The annual report of the Quincy M. Co. for 1900 shows the following figures:

|                                           |            |
|-------------------------------------------|------------|
| Average number men employed.....          | 1,366      |
| Average number miners employed.....       | 433        |
| Wages of miners per month.....            | \$62       |
| Yield mineral per fathom, fms.....        | \$512      |
| Yield refined copper per fathom, fms..... | \$391      |
| Total ore mined, tons.....                | 650,545    |
| Total ore hoisted, tons.....              | 590,166    |
| Stamp ore treated, tons.....              | 558,723    |
| Mineral from stamp mill, fms.....         | 13,818,830 |
| Mineral from ore houses, fms.....         | 4,672,919  |

## MONTANA.

## FERGUS COUNTY.

Reeder, Harmon & Williams, operating the Pheasant of Ruby gulch, 7 miles from Lewistown, have ore running \$82.40 to the ton. A cyanide plant may be put in.

## GRANITE COUNTY.

The yield of the sapphire mines, now being worked on the west fork of Rock creek, 35 miles southwest of Philipsburg, for the year 1900 is given at 200,000 carats of rough crystals, 1200 carats being fit for cutting.

## PARK COUNTY.

Livingston reports a gold strike in three of the ten claims of the Milwaukee-Montana Co., free milling quartz knit together with native wire gold, \$19 to \$300 per ton.

## SILVER BOW COUNTY.

Progress is being made on the new smelter going in on the Anaconda, at Butte; the old smelter will be rebuilt and fitted with modern machinery; it is reported that the fire in the mine is extinguished and that good ore is now being taken out of the burned district.

## NEVADA.

## HUMBOLDT COUNTY.

At the National at Unionville ore running 350 ounces silver and \$50 gold to the ton is reported. The property is owned by Surveyor-General Kelley.

## LINCOLN COUNTY.

The Woodbutcher, at Blind mountain, near Pioche, is reported sold to Vietti & McDonald for \$5000.

## WHITE PINE COUNTY.

The new mill of the Ely M. Co., at Ely, is ready to start.

## NEW MEXICO.

## BERNALILLO COUNTY.

Santa Fe men have bought a one-third interest in the Little Mollie, near Bland.—The Monster, South Cross, Smuggler, Corenna and Sunny South claims, near Bland, may be sold to New York men; should deal go through, a reduction works will be built on Washington hill.

## COLFAX COUNTY.

Rich strikes are reported made in the Bobtail and Senate mines, near Elizabethtown; ledge is said to be 18 inches wide, ore running \$500 to the ton; properties are owned by the Smithfield M. Co., Pittsburg.

The Baldy tunnel is in about 200 feet; the company will put in a new plant and will drive the tunnel to the 3000-foot mark.

## GRANT COUNTY.

The Whitney G. M. Co., capital \$500,000, is incorporated at Silver City. Operations are progressing satisfactorily on the Dover, at Pinos Altos.—The Hanover is shipping concentrating ore to the Empire mill.

## SANTA FE COUNTY.

The new 150-ton per day lead concentrator recently built by the New Mexico Lead Co. in the San Andreas mountains, near Ploma, is running successfully; concentrates run up to \$12 per carload; an air compressor and drills will go in.

The Colorado Fuel & Iron Co. is laying a pipe line from its works at Madrid to the new hard coal mine, 1 mile distant, to supply compressed air for the hoisting and other machinery; this is being put in as an experiment to obviate, if possible, the necessity of putting in a battery of boilers at the mine; a railway is being built to carry coal to the breaker.

## OREGON.

## BAKER COUNTY.

Near Baker City, the Quebec mine, Carr & Farris, will build a 10-stamp mill.

## DOUGLAS COUNTY.

C. R. Ray of Gold Hill is pushing work on the Gold Bug Extension, 18 miles from Glendale.

## JACKSON COUNTY.

Operations are in progress on the Dixie Queen, on Foothills creek, near Gold Hill.—McKee and others of Portland, who recently bought the Anderson, near Gold Hill, will begin work immediately; later they will put in a mill.—Work will be resumed on the Lost Cabin, near Gold Hill.—All giants on Foothills creek are running steadily under full heads.—There are five stamp mills running steadily within a radius of 8 miles of Gold Hill, which crush ores from about twenty-five mines in the same locality.—There are said to be 100 placer claims in operation near Gold Hill.—Operations are progressing on the Bill Nye, near Gold Hill. A new strike is reported made, the vein being about 3 feet wide and the pay streak about 10 inches in width along the hanging wall; the shaft is down 150 feet.—A company is incorporated to work the Klondike, on Ash creek, near Hornbrook, Cal.; a mill will go in immediately, and operations at the mine will be pushed.—Hydraulic operations are resumed at mines on the Klamath river, near Hamburg, with the exception of the Siskiyou, which recently lost over a mile of ditch and fluming; Supt. Sharpegger expects to resume about March 1st.—Work on the Opp, near Jacksonville, is progressing favorably. Preparations are under way to put new machinery in this spring.

## JOSEPHINE COUNTY.

Work on the Golconda, on the Applegate river, near Proval, 12 miles from Grants Pass, is under way under A. C. Taylor, Pres. Golconda M. Co. The drift on the 130-foot level is in 120 feet; the vein averages 2 feet in width, ore assaying \$12 per ton. The major part of these values is in sulphurets, with a few dollars to the ton in free gold.—A recent clean-up at C. E. Wickstrom's claim, on Pleasant creek, near Grants Pass, gave twenty ounces of gold.—The Mt. Fielder (quartz), near Woodville, is bonded to Olsen & Parsons of Seattle, Wash., for \$4500; there is a 300-foot tunnel on the property.—The old Bennett (quartz), on upper Jump-off-Joe, is now being operated by M. Carter of Wimer.—Burns & Markham, operating the Burns & Markham, on Limpia creek, near Grants Pass, have sunk a 54-foot shaft and are now crosscutting at that depth.—It is reported that an offer is made to put in a 200-ton smelter at Grants Pass, providing 200 tons of ore per day are guaranteed by mines near there.—Reports from Gold Hill state that a body of \$1000 ore is opened up in the Lucky Bart, near there.—Work is in progress on the Moon, on Galice creek, 25 miles from Grants Pass, owned by C. R. Ray of Gold Hill.

## SOUTH DAKOTA.

## PENNINGTON COUNTY.

A new hoist and pumping machinery will go in on the Golden Slipper, near Hill City.

The Reinhold M. Co. of Custer and Omaha, Neb., will erect a plant for the treatment of manganese ore at Omaha.

## UTAH.

## BEAVER COUNTY.

Work is resumed on the Old Talisman, in Star district, near Milford, operated by Kohl & Murdock of Milford. The vein carries high-grade silver and lead values.—J. T. Kelley of Shantil, operating the Anvil and Magnolia mines, near there, will begin shipping ore.

## BOX ELDER COUNTY.

The Golconda M. Co., Manager Joseph, has let a contract for 50 feet of additional work on No. 1 ledge of the Golconda at Park Valley. The company is drifting on No. 2 ledge preparatory to erecting a mill.

## IRON COUNTY.

The Stateline G. M. & M. Co., capital \$30,000, is incorporated at Stateline to work the Malburn, Marion and Bob Clough claims, near there.

## JUAB COUNTY.

The New York Grant M. Co., capital \$500,000, is incorporated to work the Grant group, in Johnson's Peak district: W. Babcock, manager.

The North End at Eureka, Tintic district, is sold to the Raymond M. Co. for \$15,000. The property will be developed by a drift from the main shaft of the Raymond. The latter, now down 800 feet, will be continued to the 1000-foot level, at which depth a crosscut will be run.—Work on the Victoria at Tintic will begin again. The property will be opened through a north drift from the Grand Central on the 900-foot level.—Ore is opened up in a winze on the Lower Mammoth at Tintic.

## SALT LAKE COUNTY.

The furnaces of the new Highland Boy smelter at Bingham, Supt. R. White, are treating 465 tons of ore daily.

The West Mountain Copper Co. of Bingham will begin work there.—The Red Wing, Bingham, is shipping ore.—Supt. M. D. Murphy reports the Dalton & Lark drain tunnel at Bingham in 200 feet, and that progress is being made at the rate of 5½ feet daily. Ten men are employed. The tunnel will be run to the 5800-foot point.—The Highland Boy at Bingham, Supt. Channing, is shipping over 400 tons of ore daily.—The Dewey mill in Bingham canyon, near Bingham, is running on Northern Light ore.

## TOOELE COUNTY.

The Sunshine mine and mill in Camp Floyd district, near Sunshine, are sold to G. C. Moore and Eastern associates for \$300,000. Work will begin immediately and the mill will be enlarged.—The Con. Mercur at Mercur shipped its January output of gold bullion to the sub-treasury at New York.

## WASHINGTON COUNTY.

The St. George M. Co. of St. George made the final payment of \$55,000 on the Dixie group of mines and smelter, near St. George, on the 23rd ult.

## WASHINGTON.

## FERRY COUNTY.

The Last Chance group, near Keller, is bonded to G. Holbrook of Spokane.

## OKANOGAN COUNTY.

The Lakeview tunnel, on Mount Elieham, near Loomis, is in 265 feet.

## SPOKANE COUNTY.

The Ballarat Copper M. Co., capital \$100,000, is incorporated at Spokane.

## STEVENS COUNTY.

The Globe Fields M. Co., operating in the Flat Creek mining district, near Ryan, 15 miles from Northport, are pushing work.

## WYOMING.

## ALBANY COUNTY.

The Rambler (copper), 25 miles southwest of Laramie, is reported sold to an Eastern company for \$110,000.

## CARBON COUNTY.

A Boston company will operate the Charter Oak, near Grand Encampment; ore is said to carry 4% copper and \$3 gold to the ton.—The Mammoth Copper Co. will drive a 900-foot tunnel on its property, 2 miles north of the Ferris Haggerty, near Battle Lake.—Work on the new smelter at Grand Encampment is progressing.

## FOREIGN.

## AUSTRALIA.

The report of the Broken Hill Proprietary Co., Ltd., of New South Wales, for the half year ending Nov. 30, 1900, shows that during the time stated there were

treated 129,951 tons ore, yielding in round numbers 20,000 tons lead, 337 tons antimonial metal, 2,780,937 ounces fine silver, 3427 ounces fine gold. The price received for the silver averaged 2s 6d per ounce; lead, £16 16s per ton; copper, £72 10s per ton; spelter, £19 per ton. The company has secured a reduction in the cost of water at Port Pirie—now paying 2s per 1000 gallons, instead of 6s, as formerly.

#### BRITISH COLUMBIA.

The Dominion Government has decided to open an assay office in Vancouver, at which gold will be purchased from returning miners at its full value, in the same manner as during the past season it has been purchased at Seattle for the United States Mint.

On the Eclipse, on Fish creek, Lardeau, ten men are employed; ore is a silver-lead and assays \$80 to the ton.—A tunnel is being driven on the Black Warrior group, 9 miles from Ferguson; it is now in 210 feet, and is expected to reach the ore chute in the next 70 feet.—The Great Northern group, north of Trout lake, Lardeau, is bonded to A. B. Clabon, of Rossland, representing Eastern Ontario men, for six months.—The ledge in the Iron Cap, of the McDonald group, near Windermere, is reported out in the 400-foot crosscut tunnel.—A tunnel is being run on the Bugaboo group, 18 miles from the Columbia river, Windermere district.—The St. Eugene concentrator, at Moyie, Southeast Kootenay, is running.—Ore from the Big Swede, Kimberley, carries 10% lead, with values in gold and silver.—Operations on the Wonderful, Slocan, are suspended temporarily.—The Surprise, in McGuigan basin, has seven men working.—The Prescott group, near Silverton, is bonded to C. C. Bennett, of Vancouver, representing a company; work is now under way.—At the Pontiac, on Woodbury creek, operated by C. J. Caldwell, of Kaslo, three tunnels are being run to tap the ledge.—The Rambler-Cariboo is shipping 200 tons of ore monthly to the smelter; No. 3 tunnel, now in 1600 feet, will be driven 2000 feet farther; a crosscut will be run from the 1500-foot or main level to cut showings of dry ore and galena which have been opened up in several places.—The stamp mill at the Waterloo, at Camp McKinney, will be started March 15th.

The Rosebery group, of the Carnes Creek Con. M. Co., between the north and south forks of Carnes creek, north of Revelstoke, is developed to a depth of 300 feet; ore is said to run \$1 to \$80 gold, 40 ounces silver and 5% to 20% copper to the ton.—The Standard group, owned by the Prince M. & D. Co. of Revelstoke, consists of nine claims; ore runs \$1 to \$4.35 gold, 24 cents to \$6 silver and from 5% to 23% copper to the ton. Four tunnels are driven on the property.—From August 21, 1900, to February 1, 1901, the Granby smelter at Grand Forks treated 81,000 tons of ore, which produced 2700 tons of 50% matte; the present capacity of the plant is 600 tons ore per day. It will be doubled before May 15th.—Good ore bodies are opened up on the 250 and 350 foot levels of the Green Mountain, at Rossland.—At the Spitzee, the shaft is down 63 feet.

#### KLONDIKE.

It is estimated that Lippy's claim No. 16, on El Dorado creek, near Dawson, will be worked out at this season's cleanup.—It is reported that Gov. Ogilvie will resign.

A strike of rich ore is reported made near Lepine creek, within 15 miles of Dawson, ore assaying from \$36 to \$84 to the ton; ore is said to be free milling.

#### Publications Received.

"California Miners' Association Report of 1900 Convention." This is an excellent idea, finely carried out. It is a handsome book of 255 pages, well illustrated, being an exact verbatim account of the proceedings of the ninth annual convention of the California State Miners' Association, held in San Francisco last November. It gives in detail all that was done, including all debates, resolutions, committee reports, etc., and, next to having been there, any one reading it could not have a better idea of just how the California miners transact their annual deliberations. A copy will be sent by the secretary, Mr. E. H. Benjamin, to every member of the association. Others desiring a copy should send him 8 cents for postage thereon. His address is 331 Pine street, San Francisco, Cal.

"Report of the Colorado Bureau of Mines, 1899-1900." Seldom has there been put in seventy pages matter of more practical value to miners in and out of the State of Colorado. The statements and suggestions it contains are of immediate interest, the statistics are accurate and up-to-date, and there is not a line of padding. It can be had from Mr. Harry A. Lee, Commissioner of Mines, Denver, Colo.

#### Personal.

L. H. BROWN of New York has gone to Siberia.

E. B. ANDERSON is nominated to be Surveyor-General of Utah.

R. G. BROWN has been re-elected manager Standard Con., Bodie, Cal.

S. P. CONGER of Selma, Or., has returned there from Denver, Colo.

J. E. BAMBERGER, manager Daly-West, Park City, Utah, is in New York.

J. R. DELAMAR of the Con. Mercur, Mercur, Utah, is in San Francisco.

M. WHELAN of Seattle, Wash., will be Supt. Anderson, near Gold Hill, Or.

CLARENCE S. KING has returned to California from a Mexican itinerary.

R. WALKERS of the Showers Con. M. Co., Diamond, Utah, is in San Francisco.

G. B. SESSIONS is the new superintendent of the West Argent mine, Stockton, Utah.

JAMES PARK succeeds the late Prof. Ulrich as director of the School of Mines at Otago, N. Z.

FRED ZEITLER, vice-president California Miners' Association, has returned from San Francisco to Nevada county, Cal.

P. A. H. FRANKLIN (president) and M. P. Gilbert (manager), Blackbird Copper & G. M. Co., Idaho, are in New York.

W. B. DILLINGHAM has returned from San Francisco to Vladivostok, Siberia, to resume charge of quartz mining operations in the interior.

LEONARD HAMMOND CARVER of San Francisco has been appointed chief engineer of the McCloud River Electrical Power Co. of Shasta county, Cal., and is now in the country looking over the ground.

GEO. MITCHELL, general manager Greene Con. Copper Co., Sonora, Mexico, proposes to build a smelter, and narrow-gauge road 6 miles in length. He also projects a broad-gauge road 42 miles from the mine to Naco, Arizona.

LEW E. AUBURY, W. L. WATTS AND WM. IRELAN are mentioned in connection with the appointment by Gov. Gage of State Mineralogist of California to succeed the retiring incumbent, Mr. A. S. Cooper, whose term expires this month.

J. K. CARPENTER has returned to Oakland, Cal., from Sumatra, where for eight months he was investigating mining propositions. He was one of the few saved from the wreck of the P. M. S. Co.'s China steamer, the Rio de Janeiro, which was lost a few miles from San Francisco on the 22nd ult. He lost all his papers and notes.

#### List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,  
PIONEER PATENT SOLICITORS  
FOR PACIFIC COAST.

FOR THE WEEK ENDING FEB. 19, 1901.

- 668,551.—SLAT FASTENER—M. L. Akers, Ione, Or.
- 668,279.—PUNCHING BAG—W. C. Bean, S. F.
- 668,481.—SEWING MACHINE—C. H. Benoit, San Jose, Cal.
- 668,305.—CAN HEADING MACHINE—W. S. Case, Haywards, Cal.
- 668,488.—AMALGAM SQUEEZER—J. V. Coleman, S. F.
- 668,285.—BOOT CLEANER—F. Dayton, Portland, Or.
- 668,556.—CLOTHES WRINGER—F. H. Edmonds, Ridgefield, Wash.
- 668,307.—PULLEY—F. F. Fenlason, Seattle, Wash.
- 668,171.—FIREPLACE FRONT—E. J. Field, Spokane, Wash.
- 668,287.—DEGERMINATING WHEAT—J. Frey, San Miguel, Cal.
- 668,181.—CURTAIN FIXTURE—C. C. Haub, S. F.
- 668,375.—AIR SHIP—A. F. Hubbard, Simmler, Cal.
- 668,292.—VEHICLE TIRE—F. J. Johnston, Sacramento, Cal.
- 668,451.—ENGINE—J. D. McFarland, Jr., S. F.
- 668,536.—RAILWAY CAR—F. C. Millar, Tracy, Cal.
- 668,337.—LUBRICATOR—O. Newhouse, S. F.
- 668,317.—MINER'S CANDLESTICK—G. T. Parsley, Hornbrook, Cal.
- 668,343.—SAWMILL—A. E. Roe, New Whatcom, Wash.
- 668,320.—SOLDERING TOOL—W. A. Rose, Santa Rosa, Cal.
- 668,300.—INSULATOR—H. E. Waite, S. F.

#### Recently Declared Mining Dividends.

Payable.  
Eureka M. Co., California, \$10,-  
000.....Feb. 25

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MINER'S CANDLESTICK.—No. 668,317. Feb. 19, 1901. G. T. Parsley, Hornbrook, Cal., one-half interest assigned to J. W. Downing, same place.

This invention is for an improvement in devices for holding candles in mining shafts, tunnels and like places. It consists of a handle having parallel extensions, a pointed arm, and a hanging hook having split ends and pivots by which they are turnably held between the extension sides with lugs and notches whereby they are locked in operative position. A bent arm extends from one of the extension sides and there is a thimble or holder for the candle, having an elastic tongue between which the pivot pin passes, and an elastic arm extending tangentially from one end.

VEHICLE TIRE.—No. 668,292. Feb. 19, 1901. F. J. Johnston, Sacramento, Cal.

This tire is of the class of resilient tires used for vehicles and consists of an outer tube with a filling of light elastic material in transverse sections centrally pierced, and a binding rod running through these sections, with means for connecting the ends of the rod, and means extending from the ends of the rods through the rim by which these ends are adjusted from outside the tire.

CAN HEADING MACHINE.—No. 668,305. Feb. 19, 1901. W. S. Case, Haywards, Cal.

This machine is designed for placing the heads upon the ends of metal cans and consists of endless chains of segments adapted to grasp the cans between them, wheels or drums journaled with relation to each other, so that the two sets of segments will be brought together and caused to register and travel in a line between the receiving and discharge end and means for supplying can bodies and can heads simultaneously to the central and end portions of the segments.

REVOLVING CYLINDER ENGINE.—No. 668,451. Feb. 19, 1901. J. D. McFarland, Jr., San Francisco, Cal., one-half interest assigned to John Bruckman, same place.

In this invention the cylinders are mounted radially with relation to an axis about which they are revoluble, and the piston rods of the cylinders are connected with a second shaft which is eccentrically placed with relation to the first-named shaft, so that a reciprocation of the pistons in the cylinders is produced by their revolution around the two centers; means are provided for the admission and exhausting of the propelling medium, which may be steam, air or gas, and by means of sleeves upon the shaft with which the piston rods connect, the admission and exhaust passages which pass through the shaft may be made to connect with the hollow piston rods, and thence with the interior of the cylinders so as to propel the engine, and by a movement of the sleeves the engines can be reversed.

LUBRICATOR.—No. 668,337. Feb. 19, 1901. Oscar Newhouse, San Francisco, Cal.

This invention is designed to be used in connection with lubricating devices for axles and shafts, and particularly for the use of heavy lubricants or grease, such as are not sufficiently liquid to flow. The lubricant is contained in a chamber and a cap is so disposed as to be removed with relation to the chamber, so that when advanced it will force the lubricant out.

MACHINE FOR DEGERMINATING WHEAT.—No. 668,287. Feb. 19, 1901. John Frey, San Miguel, Cal.

This apparatus is designed to scour and remove the germs from wheat and like grains. It includes contiguous smooth-surface metallic disks, one movable with relation to the other, and each having pockets or pits with sharp edges or angles into which the grain may fall, with one end projecting, and in this position the edges of the pockets of the other disk act to cut off the tips or ends of the grain containing the germ, and at the same time to scour and cleanse the grain.

#### Obituary.

SENATOR EVARTS, who died in New York City on the 28th ult., was famous as the man who once got \$250,000 for his legal advice in a New York City case. It consisted in answering "Yes" to a question, and the affirmative reply is said to have cleared his clients \$2,000,000.

#### Latest Market Reports.

SAN FRANCISCO, Feb. 28, 1901.

SILVER.—Per oz., Troy: London, 28½d (standard ounce, 925 fine); New York, bar silver, 61c (1000 fine); San Francisco, 61c; Mexican dollars, 50c.

The London Statist thinks that apart from the possibility of a great silver mining combination, and the effect on the price, there is the prospect that the price may gradually improve, as a result of the world's normal consumption. The Indian Government is obliged to purchase fifty million ounces annually and the demand for China will possibly be larger than hitherto. With the normal demand and the subsidiary coinage for trade purposes, the conditions warrant the opinion that silver will permanently command a higher level than witnessed in recent years.

COPPER.—New York: Lake, 1 to 3 casks, \$16.87½; carload lots, 16.50; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.35; Casting, 1 to 3 casks, 16.50; carload lots, 16.35. San Francisco: 18. Mill copper plates, 20c; bars, 22¢@23c.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; Missouri lead, \$4.32½ desilverized lead; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £14 12s 6d per ton=3.17 cts. per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £17 12s 6d per ton=3.82½ cts. per lb; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13¢@14c; 100-lb lots, 15¢@18c.

IRON.—Pittsburg, Bessemer pig, \$14.00; gray forge, \$13.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$20.75; open hearth billets, \$21.75; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.75; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, 31c, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 ½ flask of 76½ lbs.; Export, \$45.00

The yield of the Almaden, Spain, mines during 1900 is stated to have been at 30,612 flasks—about 1171 tons.

MAGNESIUM.—New York, \$2.90 ½ lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c ½ lb. small lots.

BISMUTH.—New York, ½ lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 ½ lb. lots.

PLATINUM.—San Francisco, crude, \$17 ½ oz.; New York, \$18.20 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, ½ lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50¢@60¢ ½ lb.

PHOSPHORUS.—F. o. b. New York 50¢@60¢ ½ lb.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%; carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kgs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½¢ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 32½¢@33½¢ ½ lb.; carloads, 30¢@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ½ lb.; soda ash, \$1.90 ½ lb. 100 lbs. 58%; hyposulphite of soda, 2½¢@3c ½ lb.; blue vitriol, 5½¢@6½¢ ½ lb.; borax, concentrated, 7¢@8c ½ lb.; chlorate of potash, 12¢@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½¢@2c; California refined, 1½¢@2c; nitric acid, in carboys, 8c ½ lb.; caustic soda, in drums, 3¢@4c ½ lb.; Cal. s. soda, bbls., \$1.00; sks, 95c ½ lb. 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

## SITUATIONS WANTED.

MINING ENGINEER DESIRES A POSITION AS mine superintendent. Thoroughly experienced stamp mill man. References. "M. B. I." this office.

**PRACTICAL MINER and TOOL SHARPENER,** fifteen years' experience in the United States and British Columbia, would like a position. Address "D." care of this paper.

**WANTED.**—A position as superintendent for a mining company by a man of 16 years' practical mining experience; understands mining and milling (amalgamation, concentration and leaching); good assayer and accountant; would accept a subordinate position if good; references. Address "Advertiser," 1225 Webster St., Oakland, Cal.

**CHEMIST AND ASSAYER,** with experience in draughting, bookkeeping and typewriting, desires position as assayer or assayer and bookkeeper in mine or as secretary to mining engineer or mine official. Has fair literary and scientific education. Experience in the preparation of reports, prospectuses and catalogues. Excellent moral character and good health. For further particulars, address E. E. M., care Mining and Scientific Press.

**Mining Engineer,** technical graduate, with nine years' practical experience, wishes position as manager or superintendent of mining or milling proposition. Thoroughly competent and reliable, best of references. Understands draughting, buying machinery, erecting, operating. Experience with all chemical processes, cyanide expert. Speaks Spanish, familiar with Mexico, prefer position in the U. S. Address Box 25, this office.

**Situation Wanted by Mining Engineer of 20 years' experience in California, Colorado, Mexico and Germany.** Has had charge of large properties—gold, silver, lead, copper, sulphur and oil. College graduate; good assayer, surveyor and accountant; speaks Spanish. Has experience in railroad construction and road building. Formerly U. S. deputy mineral surveyor and member of geological field force. Will go anywhere. Address P. M., Mining and Scientific Press.

**Position as Superintendent** of a gold mine or mill desired by an experienced mining engineer and metallurgist. Competent to take full charge of a gold mine or mill. Technical graduate. Good assayer, surveyor, etc. Can leave present position on short notice. Salary moderate. Address "B. Sc." care of this paper.

**Engineers, Firemen, Machinists, Electricians:** Send 5 cents for new 40-page pamphlet, containing list of questions asked by examining Board of Engineers. GEO. A. ZELLER, Publisher, St. Louis, Mo.

**NOTICE TO LEASERS.** SEVERAL CONTRACTS for drifts and raises in country rock to be let to responsible bidders. For particulars, apply to MR. W. S. HASKINS, Iron Mountain, Shasta Co. By order of the Mountain Copper Co., Ltd., Keswick, Shasta Co., Cal.

**AUTOMATIC SAMPLING</**

## DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

### SOLAR HOUSE LIGHTS

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs **\$4.00** Per Light  
EACH LIGHT LASTS A  
LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Excels any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the safest, steadiest and richest light that is known.  
Write us for particulars.

100 POUNDS OF ORE SAMPLED IN 10 MINUTES.

## Calkins' Umpire Ore Sampler.

An accurate, quick and absolutely impartial machine for sampling ore in quantities of from one to one hundred pounds.

Easily operated and cleaned.

No danger of salting subsequent samples.

Makes the operation of sampling an easy one; and all competent

assayers know that to obtain an assay sample by hand

requires more trouble and time than is necessary to re-

duce the resultant sample to the pulp.

Diagonally opposite portions are taken each time; and assay samples are ob-

tained with this machine in less time and with less trouble than by any other method.

Capacity from 15 to 45 tons in 24 hours, according to class of ore.

Our illustrated catalogue contains all the latest information on the concentration of ores. Mailed on application.

**THE COLORADO IRON WORKS CO.,**

Established 1860.

DENVER, COLO., U. S. A.

# THE GRIFFIN THREE ROLLER ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

# The Right Roofing.

P. & B. Ready Roofing is the right roofing for buildings. It is made of strong, closely woven jute canvas, saturated and coated with P. & B. Compound. It is fire resisting: cannot be ignited by sparks or brands of fire. It is not affected by steam, gases, sulphur smoke, fumes, acids, alkalis, heat or dampness, neither will it scale, sun crack or run in the intense heat of the sun. Extreme cold does not injure it, and snow will not remain on sloping roofs covered with it. It is a non-conductor: renders the house cooler in summer and warmer in winter. P. & B. is the right roofing. Send for booklet—address department "A."

## A Dry Pulverizer

FOR ORES, CEMENT and  
HARD SUBSTANCES.

Equals a 50-ton stamp mill. Grinds to any mesh under 8.  
No slimes, no choking. Takes any fineness of feed under 1 in.  
No special foundation. No quartered belts. No internal screens. Outside separation gives 100 per cent product most uniform and granular.  
No oil in product. No stoppages for oiling or adjusting.  
Can be used wet. Can be moved on a truck. Guaranteed for one year. Free new for worn out parts.  
Little wear, no duplicate parts, no break-downs.  
Cost 1/4 to 1-10 of any installation of same capacity.  
Takes only one-half the horse power. Is automatic.

For Particulars and Catalogue

**KENT MILL CO.,** 5 Beekman St., NEW YORK.

## THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1 1/2 to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

## STRICTLY C. P. ACIDS

MANUFACTURED BY  
The Western Chemical Co.,  
DENVER, COLO.

For Laboratory Use and Fine Chemical Work.

PURITY GUARANTEED.

## and C. P. AMMONIA

Also COMMERCIAL ACIDS.

# CATES IRON WORKS,

650 Elston Ave., = CHICAGO, U. S. A.

It is now twenty years since we designed and began to build the GATES GYRATORY ROCK AND ORE BREAKER, since which time we have built nearly 5000 of these machines and set them at work in every quarter of the globe. The success attained by the introduction of this wonderful invention has been equaled by few triumphs in mechanical arts. We have constantly been improving the construction of the machine, and although in the lapse of time many of the original patents have expired, the Gates Breakers to-day are covered by more patents than ever before. We have continually been increasing the size of these machines until now we offer the public our size 9, weighing 150,000 lbs., having a capacity of **200 TONS PER HOUR**, and receiving masses of rock or ore weighing more than half a ton.

There are more than two hundred of these Breakers in the South African gold mines.

The Homestake Mining Co. of South Dakota, one of the largest mining properties on the North American Continent, paying a dividend every month, and having ore enough in sight to keep its 1000 Stamps busy for fifty years, uses

## 15 GATES ORE BREAKERS

and buys Gates justly celebrated Stamp Shoes in lots of 10,000.

We build every class of strictly modern

## MINING MACHINERY.

For instance: The Trail Smelters and the Granby Consolidated Mining & Smelting Co.'s plant were supplied by us, and they are the model smelting plants of British Columbia. We guaranteed a capacity of 500 tons per day in the Granby Co.'s two furnaces, while they average 600 tons per day, and have handled as much as 736 tons of copper ore in twenty-four hours.

Gates Mining Machinery is always a little better than it is guaranteed to be.

We build the following Specialties besides those above mentioned: **Stamp Mills, High Grade Rolls, Dryers, Roasting Furnaces, Hoists, Elevators, Screens, Concentrators of every class.** and, in short, every improved mechanical device for working and reducing the precious ores. We built the first Stamp Mill ever set up in the Rocky Mountains. Our manufacturing history covers a period exceeding sixty years. We publish seventeen booklets fully describing our

**MINING MACHINERY, CEMENT MAKING MACHINERY,**  
**ROCK AND ORE CRUSHING PLANTS, Including Ballast and Macadam Plants.**

❀❀ In the issue of this paper of February 16th, we illustrated our ❀❀

## STANDARD BURNER.

THIS IS AN ILLUSTRATION OF OUR NEW

## COMBINATION

## FURNACE,

which we make in two sizes.

PATENTED FEBRUARY 7, 1899.

Work in the crucible chamber of this furnace may be carried on without interfering in any way with operations in the muffle.

No Experiment --- The result of experience. All inquiries answered fully. For sale by dealers everywhere.

**Wm. Hoskins & Co.,**  
**81 So. Clark Street, CHICAGO.**

## THE Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods. An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

**Nine Thousand Wheels Now Running,**  
Averaging some 700,000 H. P.

### ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries. Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

**The Pelton Water Wheel Company,**  
121 & 123 MAIN STREET, SAN FRANCISCO, CAL.

## KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of The Knight Water Wheel, direct-coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing. These wheels are designed for 100 to 2500 H. P. Highest efficiency and regulation guaranteed.

WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING.  
Wheels for mill and reversible hoisting works a specialty.

**KNIGHT & CO., Sutter Creek, Cal.**  
For full particulars, send for descriptive catalogue.

## General Electric Company's Electric Blowers and

Blower Driven by 5 H. P. Direct Current Motor.

### Exhaust Fans

may be run with less attention than any other motive power.

**Don't Take Chances**  
of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore.  
OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings,  
and our record of results—showing in almost every instance achievements on the large scale such as  
we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a  
Specialty of  
**CYANIDE WORK**  
and claim to have introduced the use of Cyanide to this Western country by the  
**MACARTHUR-FORREST PATENT METHODS.**  
Many of the large low-grade propositions in the West owe their success entirely to these processes:  
our experts, however, are constantly devising improvements, the latest being a method of overcoming  
the difficulties which have hitherto prevented the successful handling of ores containing copper and  
also a method for the profitable handling of silver ores by cyanide.

## SMOOTH-ON IRON CEMENTS

For stopping leaks and pitting in MARINE BOILERS, for boiler patching, for repairing leaks or fractures in steam or hydraulic work, and for repairing blemishes in iron or steel castings. These cements are prepared in powdered form and applied by mixing with water. When hard they will withstand a red heat, steam, water, or oil, and expand and contract the same as iron. Write for illustrated catalogue and prices. When ordering state for what use.

Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MESSRS. MADISON, BRUCE & SELLERS,

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says.  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

ASSESSMENT NOTICES.

ALLIANCE EXPLORATION & MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of February, 1901, an assessment (No. 3) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of April, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of February, 1901, an assessment (No. 2) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 4th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOSEB, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SPANISH CONS. QUARTZ MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of February, 1901, an assessment (No. 4) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of April, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

B. N. SHOCRAFT, Secretary.

Office—113 Crocker Building, San Francisco, California.

DELINQUENT SALE NOTICE.

YUBA RIVER GOLD DREDGING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Smartsville, Yuba County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 4th day of January, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

# THE "PELATAN-CLERICI" PROCESS

## OF TREATING REFRACTORY ORES

General  
Arrangement  
of  
Pelatan-Clerici  
Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

FOR PARTICULARS, WRITE TO

**THE RISDON IRON WORKS,**  
SAN FRANCISCO, CAL.  
AGENTS.

## The JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY  
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS  
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Send for  
Catalog No. 14.

## The Latest in Metallurgy.

So many apparently chimerical theories have been ultimately made practical and profitable that men hesitate to pronounce any proposition impossible, though, often, in mining and metallurgy, "processes" and propositions are put forward with extravagant claims that fall before practical test. The latest in metallurgy is the claim made by Dr. Miller of Mt. Pleasant, Pa., whose idea is that he will "revolutionize" smelting. Everything else in the mining and metallurgical world has been about to be "revolutionized" several times, and now it is the turn of the smelter.

As usual, the discovery was "accidental," and the whole matter is one of profound secrecy. Accident and secrecy are always the necessary accompaniments of all those things. The gist of this latest secret revolution is that the learned doctor takes or makes a composition which he dignifies by the name of "flux," and upon mixing this flux with asbestos, and "placing it in a crucible with raw ores the heat produced is so intense that the asbestos becomes liquefied." The alleged action of this liquefaction results in immediate separation of the metal from the ore; and without crushing or other preparation, "in forty minutes the removal of the dross from the top of the crucible shows the pure copper, lead, silver or gold beneath." This is better than anything the famous Emmens or the infamous Hartzfeldt ever claimed, though in the case of the Pennsylvania doctor he appears to have made the assertion so many times that he is beginning to believe it himself.

It further appears that experiments at the steel mills of the Fox Copper & Bronze Co., and MacIntosh, Hemphill & Co., Pittsburg, Pa., showed that the flux and the "liquid asbestos" together "removes over 98% of the metal from the crude ore without any prior crushing; this has never been possible before in the history of mining." The truth of the last eleven words in the preceding quotation can not be denied.

Not only does this combination obligingly free the

metal from the ore without any annoying labor as at present is necessary, but where the ore contains two or more metals, they arrange themselves in separate layers, so that the process is complete; further information is also vouchsafed to the effect that these "separate layers" of gold, silver, copper, etc., are each "absolutely pure," thus dispensing with the present methods of parting, or production of pure gold or silver, etc.

One would think that all this is enough, but the venerable doctor also assures us that this "flux," which, in connection with the "liquid asbestos," does all these clever things, is indestructible. That

is, certainly, in accordance with the eternal fitness of things; if it isn't, it ought to be. The inventor or discoverer or creator thereof asserts that "it can be used over and over again," never mixing with the metals, never sullyng their virgin purity, but going on and on in an eternity of perpetual combustion, for does not the doctor himself assure us that "asbestos once lighted successfully will never cease burning." The Pennsylvania chemist makes final statement that the "formula is very cheap, and will not interfere with the commercial value in the least."

The next thing, probably, will be the formation of a company and the proffer of stock. People who believe in wave motors, extraction of gold from sea water, divining rods, etc., will thus have an opportunity of being parted from their money.

## Black Hills, South Dakota.

When one speaks of the Black Hills, the Homestake mine is always first in mind. The mine, mill, works and methods have been technically described herein, and it is here referred to as a solid exponent of the mineral wealth of that region. It has employed from 1000 to 2000 men for the last twenty years, has now about 2200 men on its payroll, has paid about \$9,000,000 in dividends and has in the past eighteen months inaugurated substantial improvements that betoken the permanent character of the mine. Nearly \$1,000,000 has been expended in securing adequate water supply; \$250,000 has been put into a new hoisting plant; \$200,000 has been spent on a cyanide plant having a daily capacity of 1200 tons, and the company now contemplate the erection of another on the north side of Lead hill to treat the tailings. The illustrations give a good idea of the appearance of the Homestake M. Co.'s mills at Lead City, and of the city itself, a bustling mining center of 8000 population, on the B. & M. Railroad, "the Burlington Route." In that vicinity chlorination has also proved profitable, saving about 92% of the gold, but none of the silver, the cyanide process saving from 80% to 92% of the gold and 63% of the silver.

Lead City, South Dakota, the Mining Center of the Black Hills.

W. D. CURTIS.....223 W. Second St., Los Angeles, Cal.

San Francisco, March 9, 1901.

## TABLE OF CONTENTS.

ILLUSTRATIONS.—Lead City, South Dakota, the Mining Center of the Black Hills; Homestake Mills, Lead City, South Dakota, 120. Petroleum Oil Pipe Lines, 123. Front View of Longwall Mining Machine; Rear View of Longwall Mining Machine, 124. Diagram Showing the Surveyed and Unsurveyed Area of Western States and Territories, 125. Mining and Metallurgical Patents, 126.

EDITORIAL.—The Latest in Metallurgy; Black Hills, South Dakota, 120. A New Heat Producer; U. S. Public Lands; Miscellaneous, 121.

MINING SUMMARY.—127-128-129.

LATEST MARKET REPORTS.—129.

MISCELLANEOUS.—Concentrates, 122. Petroleum Oil Pipe Lines, 123. Extraction of Copper and Zinc; The Jeffrey Air Power Longwall Mining Machines; The Wm. P. Miller Cyanide Process; A Cement Casing for Oil Wells, 124. The Manufacture of Uranium Compounds; Internal Corrosion of Wire Ropes, 125. Mining and Metallurgical Patents; Fuller's Earth, 126. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Personal; Recently Declared Mining Dividends; Obituary, 129.

## A New Heat Producer.

Considerable space has been devoted herein to notice of the production of a high temperature by the use of aluminum, which is now proving of such commercial importance to electricians and others. The reducing power of aluminum—that is, its ability to extract oxygen from other substances—is now being utilized in a variety of industrial processes, permitting a degree of heat heretofore commercially obtainable only by the use of an electric furnace. Dr. Goldschmit of Essen, Germany, has continued the experiments previously noted and has confirmed the claims formerly advanced regarding the commercial utility of the process.

In the present state of the art there is an aluminum furnace the insulated walls of which are lined with the most refractory substance obtainable. Into this furnace is introduced ground aluminum, well mixed with iron oxide, to which is added a small quantity of barium peroxide, the latter to start the oxidation of the aluminum at a low temperature, and ignited by a ribbon of magnesium, the magnesium being set on fire with a match, flung into the furnace, when the mixture at once ignites, soon resolving itself into a liquid mass of two layers, the lower molten iron, the upper a scum of aluminum oxide. This upper scum may be poured off, the temperature of the molten iron underneath being of a degree that causes it to act upon steel plates and bars about as boiling water would on ice. The first practical use to which it has been applied is in welding steel rails. Additional use is suggested in the local softening of armor plate for drilling holes therein, welding steam pipes, casting new pieces in broken cylinders, replacing broken teeth in cog wheels, welding any large broken parts of heavy machinery, and repairing broken screw shafts at sea.

No heavy or complicated mechanism is necessary. In remote localities it can be made work on a small scale as satisfactorily as elsewhere, a small box of powder and a match affording anywhere and everywhere means of producing heat of a degree hitherto unobtainable except by the use of costly and complicated devices.

A good example of mining and scientific progress is afforded in the Black Hills country, South Dakota. The history of that region is a succinct account of scientific mining progress and evolution from the first effort to complete commercial success. As at Mercur, Utah, the Witwatersrand, South Africa, El Oro, Mexico, and parts of Australia, the gold ore was at last found to be amenable to the cyanide process, and in a comparatively small area twelve cyanide plants are now in successful operation.

## U. S. Public Lands.

Everything in connection with the administration and disposition of the public lands of the United States, and of the public domain until it has passed from under the jurisdiction of the U. S. Government, is under the direction and control of the Interior Department, in which, among other bureaus, is the General Land Office, and to which latter division is delegated direct supervision and care. There yet remain in the United States, exclusive of its island ownerships, about 1,000,000,000 acres, which is being disposed of at the rate of about 10,000,000 acres annually. A great portion of this area is still unsurveyed; the sketch on page 125 illustrates in a portion of this west half of America the proportion of surveyed to unsurveyed land. In general, of the 1,000,000,000 acres of public domain there is about half of that area unsurveyed. Of that half there are about 300,000,000 acres of "desert" or "arid" land to be dealt with by irrigation. Of these 300,000,000 acres about 70,000,000 are declared to be barren and irreclaimable. Discussion of how the remaining 230,000,000 acres shall be reclaimed has resulted in some practical effort, which, so far as the States most interested are concerned, has now come to be a question of who shall do the work, the States or the General Government. Water and forest societies have been working on it in different States and material progress has been made. The question affects the several Western States and Territories to a considerable degree.

There are in California about 17,000,000 acres susceptible of irrigation and reclamation; in Colorado, 8,000,000; in Arizona and Nevada, 2,000,000 each; in Oregon and Washington, 3,000,000 each; in Utah and New Mexico, 4,000,000 each; in Idaho, 7,000,000; in Wyoming, 9,000,000, and in Montana, 11,000,000—a total of 70,000,000 acres. The matter has been before the Legislatures of the several States and Territories and before Congress; its magnitude and extent necessarily make progress slow, but some advance is being made. About one-sixth of the vacant public domain is forest land and of this proportion there have been 47,000,000 acres embraced in thirty-eight forest reserves and there is now pending national legislation which contemplates further absorption of 54,000,000 acres for the same purpose, which, when completed, will place under permanent national control over 100,000,000 acres of forest reserves. The greater proportion of the remaining area may be considered under the general title of mineral land. This simple statement illustrates the vast extent and value thereof, and the immense possibilities in its development and use.

The manner of obtaining public land differs according to the kind and its location. In some of the older settled States all public lands are disposable under private cash entry, though also subject to the homestead law; but this rule does not apply west of the one hundredth meridian. There are some few isolated tracts subject to homestead entry for three years after the surrounding lands have been disposed of, and which can be bought upon filing an affidavit that the lands are not mineral, stone nor timber lands, when, after a public notice and public offer of sale, a tract not exceeding 160 acres can be bought by any one individual bidder. Lands valuable for timber and stone alone can be bought for \$2.50 an acre in individual tracts not exceeding in any case 160 acres. The applicant must make affidavit that the land is unfit for cultivation, is bought for his own use and benefit, that there is no bargain to sell it, and that it is non-mineral. Saline lands are purchasable on accepted proof of their being as represented, the manner of sale being at public auction to the highest bidder for not less than \$1.25 an acre. This law does not apply to the Territories. In the Pacific Coast States if such lands are not sold in the manner designated they can be bought afterward at private cash entry for \$1.25 an acre. Coal lands, while still a part of the public domain, can be bought at a minimum price of \$10 an acre, if over 15 miles from a completed railroad in operation, and \$20 an acre when at a less distance therefrom, 160 acres being the limit procurable by one person, or 320 acres to an association of any number of persons, with the exception that where four or more persons have proved the expenditure by them of at least \$5000 in

work and improvement of the coal land they may then enter 640 acres of such coal land.

Additional homestead entries are allowed to soldiers of the United States who served in the civil war of 1861-65 and who made entry of less than 160 acres of land before June 30, 1874, they being allowed to take up such additional amount of land as would complete the 160 acres originally allowable in their case. The Act of Congress of June 4, 1897, allows what is known as a forest reserve lieu land right, which permits holders of lands in forest reserves to relinquish those lands to the Government and to select equal quantities of surveyed non-mineral public land in lieu thereof. Private entries of public lands are also permissible by what is known as scrip, which is receivable for non-mineral land. That scrip has been about all bought up and used, some of it in a manner not contemplated by the Government, as in the case of California oil lands. This matter possesses considerable present interest by reason of the great activity in the California oil development, and a full exposition of the entire subject relating to scrip and title of oil lands in California appeared in the issues of April 7, 14 and 21, 1900, in the shape of a special expert article on that subject, going into the entire matter in detail and giving full particulars of the scrip, its use, and the law bearing thereon.

A very large portion of the public land that was not granted to railroad companies was taken up under what is called the homestead act, which permits 160 acres or less of non-mineral public land, surveyed or unsurveyed, to be acquired by qualified persons, the only requirements being that they cultivate and improve the land for a continuous period of five years. This, and absorption by the part of the law which permitted similar acquirement of public domain by commutation, etc., has so exhausted resource in that direction as not to require much further reference. It may be observed, however, that the full five years' residence is not required of any one who served for ninety days or more in the army or navy of the United States during the war of 1861-65, and credit to the limit of four years is allowed to such soldier or sailor in that war or the late Spanish war to apply to the five years' required residence. During 1900 there were about 8,500,000 acres acquired under homestead entries.

The desert land law is intended to aid in the reclamation of that part of the public domain concerning which it operates, and is assumed to apply solely to non-mineral and non-timbered land that without artificial irrigation is not susceptible of producing agricultural crops. This law applies to the Territories of Arizona and New Mexico and to the States of North and South Dakota, Wyoming, Utah, Montana, Idaho, Washington, Nevada, Oregon and California, and ordains that bona fide residents of those States and Territories can acquire land under the law, the maximum area to any individual being 320 acres, the price being \$1.25 per acre. So much has been said regarding the remaining class of public area, namely, mineral lands herein, that nothing further need be added, the whole subject having been gone into in detail again and again, but the foregoing is deemed of sufficient present value to warrant appearance.

It is being figured out in Clear Creek county, Colo., and elsewhere, that, taking all past and present attendant circumstances into consideration, the silver miner gets as much clear money out of the average grade ore—125 to 250 ounces per ton—at 61 cents per ounce in 1901, as he did at \$1.22 per ounce in 1878. This hardly seems possible, but inspection of the compared prices in 1878 and 1901 indicates the correctness of the conclusion. Smelting charges, price of labor, cost of supplies and difficulties of transportation were among the causes that contributed in those old days to as diminished a net profit at \$1.22 on silver production as is obtained now with silver at half that price.

The magnitude of this winter's rainfall in California may be judged by the statement that at Sacramento, in the central part of the State, last week the Sacramento river was 28.2 feet above low water mark, and within 2 inches of the highest mark recorded in the last fifty years. In addition the heavy snows in the Sierras give warrant of abundance of water for all mining operations throughout the current year.

## Concentrates.

**THERE** is no U. S. import duty on copper matte.

**SO FAR** as known, acetylene gas is not used in any mines west of the Missouri river.

**TO FIND** the horse power obtainable from one miners' inch, multiply the head of water in feet by .0024147.

**A COMMERCIAL HORSE POWER** requires—on an average—the consumption of five pounds of coal per hour.

**SO FAR** as known, there is no smelter west of the Missouri river in which nickel and antimony ores are treated.

**RETORTING** 150 pounds amalgam, 35% gold and 65% quicksilver, should yield in the redistillation from 85 to 90 pounds of the quicksilver.

**SAN FRANCISCO** uses about 400,000 incandescent lamps annually. The entire annual consumption of the United States is about 20,000,000.

**THE annual production** of tin is, approximately, 100,000 tons. Perak, in the Malay peninsula, is the largest tin-producing district in the world.

**A HEAP** of earth, the length of the slope being 45 feet from top to bottom, the slope being at an angle of 45°, has a vertical height of 31.8195 feet.

**"HARD" WATER** will take up but little lead from lead pipes; "soft" water, or carbonated water, will dissolve the lead in much greater quantity.

**BOILERS** operated at 5000 feet above sea level require 16% more air, or draft, than at the level of the ocean, and about 35% more at 10,000 feet altitude.

**FOR** photographing mines and mills a lens should be of as long focus as possible. For a 5x7 plate it should be about 8½ inches focus. Celluloid films give better results than plates.

**PROBABLY** the Mercur district, Utah, is the best American example of what metallurgical triumphs the cyanide process has won. It has created the prosperity of that section.

**A DOUBLE ENGINE** having cylinders 22 inches diameter and 42 inches stroke, steam pressure 80 pounds, when raising 3000 pounds of coal 300 feet in twelve seconds, develops 136.3 horse power.

**ORDINARILY** there is in good dynamite moisture to the extent of ½ to ¾ of 1%. A strong smell of nitric acid around where dynamite is stored suggests the advisability of its immediate destruction.

**READERS** will do us and their fellow workers some service by sending, whenever convenient, some notes of their experience in practical work. The value of such knowledge lies largely in the publicity given it.

**STEAM** is said to be superheated when its temperature is higher than that corresponding to the pressure at which it is generated, and has a reserve of heat that it can afford to lose before it comes to the condensing point.

**THERE** is a California State mining bureau, headquarters at San Francisco, and a Colorado mining bureau, with headquarters at Denver; but, so far as known, no county in either State maintains a local mining bureau.

**IF** not too expensive for the expected results, a solidly built dam is always to be preferred. A poorly constructed dam is often the dearest in the long run. Unless intended for the most temporary use, an earth dam is rarely advisable.

**WITH** few exceptions the large and handsome structures in San Francisco, Denver and Salt Lake City are the results of profit in mining, and the bulk of the manufacturing and industrial enterprises in those three cities had their start from the same source.

**A TRIPLE EXPANSION ENGINE** with four cylinders is usually made with one high pressure cylinder, one intermediate and two low pressure cylinders. A quadruple expansion engine may have one high pressure and two each of intermediate and low pressure.

**IT** may be taken as a general law in the development of engineering practice in all lines that, at first, attention is mainly centered on mere accomplishment; and then, as the principles come to be better understood, they are examined in detail for efficiency of operation.

**WHERE** one tries relocating a mining claim on the theory that a former location was forfeited by failure to do the necessary amount of work thereon, the burden is on the relocater to prove such failure in an action by the former locator to determine the right of possession.

**THE** rates for refining gold are the same at the Denver and San Francisco mints, and have been repeatedly published herein. The charges for refining at the Selby Smelting & Lead Works, San Francisco, conform to those of the two government institutions mentioned.

**DRIFT MINING** is peculiar to California on this continent, but is duplicated in every detail in Australia, where cement and blue gravel is followed under the lava capping. Some California drift mines have yielded as high as \$2.50 gold per cubic yard of material handled.

**IF** a number of adjoining claims can be developed through a tunnel to which the claims are contiguous, the required assessment work for all the claims can be done by work on the tunnel, the amount of such work in the tunnel to be equal to that required for all the ad-

joining claims. But if there are any of the claims that are not plainly susceptible of development by such tunnel work, separate assessment work must be done on or for each of them.

**A LONG-STROKE ENGINE** is by many considered the better for ordinary, every-day work. In that type the stroke is about twice the diameter of the cylinders, 20x48 inches, or 16x30. The most economical engine to buy is one whose rated horse power is a little more than the power required.

**"LIQUID STEAM"** is the somewhat suggestive but misleading name applied to a principle in use in a hot water motor whose promise has so far outrun its performance. In the motor referred to the power is generated from superheated water kept in a liquid state by strong compression.

**CUSTOM** crystallized into law ordains that where an original locator resumes work on a mining location that he had previously located, but which was about to lapse, if he continue and complete the required annual assessment work, he does not forfeit the claim and the ground is not open for relocation.

**WHERE** in miners' tools the steel has worn down to the iron, a simple test to determine whether it is iron or steel is to let fall a drop of dilute nitric acid on the bright surface of the metal. If steel, a dark spot will show—the harder the steel the darker the spot; if iron, the surface will not be altered.

**THE** average wear of shoes and dies in a gold stamp mill is dependent upon the manner in which the ore is fed, its hardness, and the make of the shoes and dies and the drop of the stamp. The wear varies from four to twenty ounces of metal per ton crushed, in the shoe, to three to eight ounces in the die.

**IT** is not considered geologically possible for petroleum or its derivatives to rise from one formation to another, the principal deposits being sealed in the containing strata. Surface indications are principally due to numberless fractures by which the contents of the porous rock can reach the surface.

**IN** assaying native bismuth the assay suitable for sulphide of antimony could be employed; a sample of bismuth residue would require cyanide of potassium, salt, potash and carbonate of soda, testing the result of the fusion for other metals. In case of bismuth alloy wet assay or analysis would be requisite.

**SECRECY** is sometimes considered a characteristic of unsuccessful "processes," possibly unjustly. It is, however, to be said that there is no "secrecy" about any successful ore treatment. As a rule, "secrecy" and success are incompatible. The greatest requisite element of commercial success is wide publicity.

**THE** Western Chemical Works, Denver, Colo., produce practically pure sulphur from ore from Gunnison county, Colo. The Peyton Chemical Co., recently organized, propose to produce sulphur and sulphuric acid at Martinez, Cal. "Blue vitriol" in large commercial quantities is manufactured as a by-product at the Selby Smelting & Lead Works, Selby, Cal.

**IT** is no difference if \$200 or \$2000 in work or improvements were put on an unpatented mining claim in any twelve months, there must be \$100 put on the claim during each calendar year till a patent is had. But all money so spent counts in the necessary \$500 worth of work and improvements, and whenever that much in total has been expended application for patent may be made.

**ON** Sept. 23, 1876, 63,135 cubic yards solid rock were completely demolished by one discharge at Hell Gate, East River, New York. There were 4427 charged holes, each containing mercury fulminate fuse and charges of dynamite. There were 49,914 explosions used in one blast. Batteries were used to generate the current, and each battery exploded 160 charges. This was the record blast.

**THERE** is no prescribed shape for placer locations; the claim need only "conform as nearly as practicable with the U. S. system of public surveys and the subdivisions of such surveys." Two locators can jointly locate forty acres of placer ground, three sixty, and so on, up to eight locations, 160 acres, which is the limit. One mineral discovery on any twenty of the 160 acres is sufficient for that entire area.

**ORDINARILY** in the practical working of a mine lease the royalty is calculated from the returns as given in the settlement sheet of the ore buyer. From the share due to the lessees is deducted the haulage, tramming, hoisting, sharpening, timber and supplies. The company may advance the supplies at cost and do the hoisting and pumping. In that case if the work prove unprofitable the loss is likely to be on the company.

**BRIEFLY** the method of working the frozen creek claims in the Yukon is by steam thawers. A small boiler is generally used, from which the steam is passed through rubber hose, to the ends of which pointed steel tubes about 4 feet in length are affixed. The latter are driven into the frozen gravel, and steam is forced through them for six or eight hours. They are then withdrawn and the thawed material removed.

**SYENITE** differs from granite in having little or no quartz, and, hence, a lower percentage of silica, which varies from 45% to 65%. It consists essentially of orthoclase feldspar and hornblende, pyroxene or mica, hornblende being the most common; and while dark mica

(biotite) is not uncommon, the light mica (muscovite) is rare. There is generally a greater proportion of the basic feldspars than in the granite. The term "syenite" was formerly used for what is now called hornblende granite. True syenite is not as abundant nor as widely distributed as granite.

**REGARDING** the inquiry as to Fahl ores from a Denver miner in the issue of the 23rd ult., a Utah miner writes that, if sufficient silver is contained in the ore in question, a chloridizing roast with salt, followed by pan amalgamation, or lixiviation with hyposulphite solutions, would give profitable result, even including the inevitable loss of silver in roasting with salt. The suggested process is in use at the Ontario mine, in Utah, where all the details could be furnished.

**IT** would be unwise to seek work at present in South Africa. There was little demand just before cessation of work at Johannesburg, and there is little likelihood of immediate resumption. About the time hostilities began white miners' wages averaged about \$80 per month. Unless one had an engagement in some prominent capacity at a contracted price for a specified time, it would be folly to think of going there in connection with mine work at present. But when work does resume there will be a probable "boom."

**TO MAKE** blue print solution, dissolve one ounce of citrate ammonia of iron in six ounces of water and in a separate bottle dissolve the same quantity of ferrocyanide of potassium in six ounces of water. Keep the solutions separate in a dark place. To prepare the paper, mix equal quantities of the two solutions and spread evenly over the surface with a sponge or soft brush. Always use fresh mixture if good results are desired. Keep solutions separate in stone bottles, corked, and mix only enough for immediate use at any one time.

**DISSENT** is expressed by several regarding the "Concentrate" in the issue of Feb. 2, which read as follows: "It is believed that the loss of gold in water used in stamp milling is too infinitesimal to take into account." Despite such dissent, however, such belief is founded on experience and maintained. Of course, normal conditions and ordinary milling practice are considered. If a millman should feed lumps of cyanide of potassium into the mortar, he must expect that an appreciable percentage of the gold will dissolve and pass off in the water.

**THE** new California law regarding charges in the office of the Secretary of State for filing articles of incorporation of mining and other corporations provides that the following shall be charged: For filing articles of incorporation, if the capital stock amounts to \$25,000 or less, \$15; if the capital stock amounts to over \$25,000, and not over \$75,000, \$25; over \$75,000, and not over \$200,000, \$50; over \$200,000, and not over \$500,000, \$75; over \$500,000, and not over \$1,000,000, \$100; over \$1,000,000, \$150; for filing articles of incorporation without capital stock, \$5; recording articles of incorporation, 2 cents per folio; issuing certificate of incorporation, \$3; filing certificate of increase of capital stock, \$5 for every \$10,000, or fraction thereof, of such increase; filing certificate of decrease of capital stock, \$5.

**IN** the Wetherill magnetic separator, by the power of its magnets and concentration of the magnetic field, substances are attracted not ordinarily affected by a common magnet. In one type of this machine the two magnets have a strength of 40,000 ampere turns; by the peculiar shaping of the pole pieces, all this force is concentrated into a space the size of half a leadpencil. The powdered ore is carried on a belt under the poles of an electro-magnet. Just over the belt and under the magnet pole, is a second belt, running crossways. When the ore passes under the magnet, the magnetic particles of it rise and are held by the magnetic force to the under side of the upper belt. This belt carries them out of the field of the magnet, and they then drop into an appropriate receptacle. Meanwhile, the unmagnetic ore goes through the same treatment again, to insure a thorough separation, and is dumped into another receiver. It is thus rendered possible to separate minerals, which are attracted by a magnet, from those which are not, and even to separate those which are attracted in different degrees.

**PROOF SILVER** is prepared in the U. S. Mint by subjecting fine silver (.999) to electrolysis, using an electrolyte of silver nitrate with 1% of free nitric acid. The bar of fine silver is carefully wrapped in filter paper and all enveloped in cotton cloth, so as to perfectly retain the impurities, such as peroxide of lead, etc., which accumulate as the bar is dissolved. The bar so protected is connected with the positive pole of the battery or other source of electricity, thus becoming the anode, while the cathode is formed by connecting a sheet of chemically pure silver to the negative pole. The silver is thrown down as crystals, which are easily washed. In this way pure silver, even in large quantities, can be easily prepared. In melting the crystals the same flux is used as in the case of gold—three parts fused borax and one part pure niter—but it is necessary to melt the bar a second time. The second melting is made without flux, and is for the purpose of removing the oxygen introduced by the niter of the flux. When the silver is perfectly melted, it is stirred with a piece of dry wood as long as the action due to the presence of oxygen continues. When this subsides, the silver is poured into a chalk-lined mold. The bar is cleaned with a brush and dilute H<sub>2</sub>SO<sub>4</sub>. After being rolled out, it is ready for use.

## Petroleum Oil Pipe Lines.

Written for the MINING AND SCIENTIFIC PRESS by A. S. COOPER,  
California State Mineralogist.

The problems which arise in the construction of pipe lines for water are also applicable to pipe lines for petroleum.

Owing to the fact that there are so many petroleum oils having different degrees of fluidity and that the fluidity of any oil depends largely upon its temperature, empirically ascertaining the flow of oil through pipe lines in the same manner as has been done with water would be a difficult and almost endless task. Even the changes in the temperature of the atmosphere would greatly affect the flow of oil. Consequently the flow of water (the fluidity of which is but slightly affected by changes of temperature of the atmosphere) has to be taken as a standard from which by comparison the flow of petroleum oil can be approximately determined.

When the fluidity of the petroleum oil is ascertained, then by comparing it with the fluidity of water the flow of the oil through pipe lines can be determined.

If a certain quantity of water in a given time flows through a pipe line, one-half as much petroleum oil half as fluid as water will flow through the same pipe line in the same time. Viscosity is a property which may be regarded as the converse of fluidity. Tables that give the flow of water through pipe lines are to a great extent applicable to the flow of petroleum oil through pipe lines, when the viscosity or fluidity of the water and oil are compared.

By the following table (No. 2) it will be seen that at a temperature of 200° F., the heavy petroleum oils will flow from ten to forty times quicker through an orifice than when the oil is at a temperature of 60° F.

Table number 2 gives results obtained with Redwood's standard viscometer, showing the viscosity or fluidity of petroleum oil at different temperatures; also the viscosity of water.

TABLE NO. 2.

VISCOSITY SECONDS FOR 50 C.C.

RESULTS OBTAINED WITH REDWOOD'S STANDARD VISCOMETER.

| Temperature. | AMERICAN MINERAL OIL. |        |        | RUSSIAN MINERAL OIL. |        |        |

The following table, number 1, has been prepared from the formula given by Thomas Box in his work on practical hydraulics. The table has been changed from English to American gallons.

"To find the diameter of the pipe requisite, having the length of pipe in yards, the head of water in feet and the gallons per minute: Divide the given head of water in feet by the given length in yards, and the nearest number thereto in the table opposite the given number of gallons will be found the required diameter.

Thus to find the diameter for 132 gallons per minute with 56 feet head, the length being 273 yards, we have  $\frac{56}{273} = .205$ , looking for which in the table opposite 132 gallons we find it 3 inches, the diameter sought.

In constructing a pipe line the consideration of the hydraulic grade is of great importance. Money will be saved by laying pipes of the requisite diameter and no larger.

A hydraulic grade line is the hypotenuse of a triangle the base or horizontal side of which is the length of the pipe line and the vertical side the length or height of the intake above the discharge. A B in figures 1, 2 and 3 show a hydraulic grade.

In constructing an oil line of piping three cases may arise by reason of the inequalities of the ground to be passed over.

1. The pipe line may lie below the hydraulic grade line.

TABLE NO. 1.

TABLE OF HEAD OF WATER CONSUMED BY FRICTION WITH PIPES 1 YARD LONG.

| AMERICAN GALLONS PER MINUTE. | DIAMETER OF PIPE IN INCHES. |         |         |          |         |         |         |         |         |          |

2. The pipe line may lie above the hydraulic grade line.

3. The pipe line may lie both above and below the hydraulic grade line.

Case 1.—Pipe line below the hydraulic grade.

Measure the length of the pipe and the head above the mouth of the pipe. These measurements will furnish a grade from which the diameter of pipe line necessary to carry a given amount of oil may be calculated.

Case 2.—Pipe line above hydraulic grade—Figure 2.

There is now a decided loss of head and the varying capacity of the pipe very much diminished if it be of the same diameter throughout. The pipe line from C to B will carry off the oil faster than the pipe line from A to C, and will in fact act like a gutter and be partially empty. To remedy this put in a pipe line having a decreased diameter from C to B or put in pipe line having an increased diameter from C to A. To calculate the requisite diameter of the pipe line A C assume that it ended at C; and of the pipe line C B assume that it commenced at C, the point where it is highest above the hydraulic grade line.

Case 3.—Pipe line both above and below the hydraulic grade line.

Divide the pipe into sections for every summit it makes above the hydraulic grade line D E F. The first section will have a head equal to the vertical distance between A D. All succeeding heads will be measured from the summit above to the next summit below, as follows: D to E, E to F and F to B. These measurements will furnish a series of heads and grades from which the diameter of pipe necessary may be calculated.

Like water, all oil contains some air; all oils also hold a certain amount of natural gas in solution. When oil has passed through a pumping engine into a force main under great pressure, it absorbs some of the gas or air in the air chamber. When the petroleum is heated by the heat of the atmosphere or otherwise, gas is generated. When oil is forced by a pump or gravity along a pipe having vertical curves and summits at different points, it parts with some of the air or gas at these summits. In time sufficient air or gas will accumulate at each summit to occupy a considerable part of the sectional area at that point, obstructing the flow of the oil, and it will continue to accumulate until the velocity of the oil is sufficient to carry the air or gas forward down the incline.

At such summits, D E F (Fig. 3) an air or gas valve is required to let off the accumulated air or gas.

When pipes are being filled there should always be ample escape for the air or gas at the summits, or the air or gas contained in the pipes will be compressed and recoil, again be still more compressed

and again recoil with great force, shooting the column of oil back and forth in the pipe with enormous force and straining every joint.

Owing to the incoherent condition of the oil sands of California and the great viscosity of the oil, nearly all the oils contain sand, salt and water in greater or less quantity. These can be to a great extent removed in a settling tank. The sand, salt and water remaining in the oil settles in the lower points of the curve of a pipe line having vertical curves. Blow-

off valves and pipes should be placed in these depressions, G H (Fig. 3), so as to flush out the sediment and water that is deposited from the oil. If the sediment and water are allowed to remain in the pipe they will retard and obstruct flow of oil through the pipes.

A design for a blow-off is shown in Fig. 4. A A is the oil pipe line; BB a pipe to catch the sediment and water. In order to save oil, water is pumped into the main pipe with a hand pump attached to the cock C. If there is any oil in the pipe B it is floated out by the water; the water also floats the oil out of the depression, so that when the blow-off cock D is opened water and sediment will be discharged and but little oil. If the pressure is so great that a hand pump cannot be used, the pipe line should be emptied as far as possible, then water should be poured into the pipe line near the summit of the vertical curve that is above the depression which is to be blown off. After the oil is replaced by the water the sediment can be removed through the blow-off without loss of oil.

Curves and bends in pipes diminish the flow of oil. An angular bend should be avoided. The larger the radius of the bend the better.

#### Extraction of Copper and Zinc.

TO THE EDITOR:—Regarding the article written on the above subject by Dr. J. Ohley, in his mention of the use of niter cake—a by-product in making sulphuric or nitric acid—I do not find his statements verified. Sodium sulphate is not a solvent of any reliable power, and niter cake also, as specified, is better, but only so far as it contains free sulphuric acid. Before much money is spent upon a process like this, it is better to erect a small working plant of, say, 300 pounds capacity, and work carefully for some time such ores as are intended to be treated; much valuable information will be gained and all weak points of the process found out and improved.

What Dr. Ohley states about the Leblanc process is valuable in a high degree, and, with all our electrical inventions, this method of manufacturing sodas and bleaching powder has not been amended for cost of production and the quality of its products. Besides these, there have been quite a lot of improvements since Leblanc's day, as, for instance, in the condensation of the HCl gas from the furnace, the saving of the heat in the Glover tower and the niter in the Gay Lussac; the better and cheaper production of bleaching powder by improvements in the Stills & "Weldon" regeneration of the manganese used. There are also revolver furnaces for the black-ash-making improved caustic soda appliances, and last, though not least, recovery of the sulphur from the waste—done at a cost of less than 20 shillings per ton of the sulphur obtained—which sells to-day at over £5 per ton; one works with which I am acquainted produces over 200 tons per week. But to obtain good working results it is needful for the works to be systematically arranged and properly erected, the employment of good workmen, an intelligent managing foreman and general overseer. Then there should be no difficulty for a works so erected and managed to pay 30% profit. This the writer knows has often been earned when such works were built and arranged as stated, and worked as a private concern, not a federation of works, such as are going here to-day. These do not, and can not, work as systematically and profitably as separate concerns have done, and much disappointment and loss of money has been caused thereby. I quite think with Dr. Ohley that this system is well worth the consideration of American capitalists and would prove a great boon to that delightful country.

So far as regards the fate of its inventor, Leblanc, went, it is very sorrowful, indeed, and inventors of to-day find, like he, that their worst enemies are the so-called chemical scholars and analysts of the F. C. S. fame. Not a word of sympathy or help need such expect unless the latter are well paid in fees and rewards, and, if these come nimbly along, then any kind of thing they will help to foist upon the public. The writer is now speaking within the limits of his own experience and knowledge, confirming the saying that "the way of the inventor is hard."

One or two words on the extraction of copper and zinc: Copper has been extracted from low-produce ores here in England, and most successfully and cheaply by the "wet process." This has been going on with results far better than those named in the issue of Dec. 29th, and at a cost of fuel and labor surprisingly low, after "burning" the ore for the manufacturers of sulphuric acid, and is still working, no better method having come to the front. Zinc extraction by "wet" methods and "dry" processes are being tried here, but up to to-day nothing done on a large scale is satisfactory. One is patented, however, which does overcome the difficulties of its predecessors and turns to account the various metals gold, silver, lead, zinc and sulphur when present in the ore. "Dry" working by the Fry & Everett process or Ellerhausen's system fall very far short of satisfaction to the science world, and also to those immediately concerned. These are items of interest also to many in the United States, as well as here.

JAMES W. WORSEY,

Chemist and Metallurgist, St. Helens, Lancashire, England.

#### The Jeffrey Air Power Longwall Mining Machines.

The accompanying illustrations show the latest design of air Longwall mining machines, manufactured by The Jeffrey Manufacturing Co. of Columbus, Ohio. Figure 1 shows a partial front view and Figure 2 a partial rear view of the machine, which is of the disc or wheel type and self-propelling.

Some of the main features of this machine are: First—It runs on a single rail, the side thrust being taken by special ties and light screw jacks, the use of one rail reducing to a minimum the liability of jumping the track. Second—It cuts its own floor—that is, cuts on the floor level. It can be built, however, to cut at any height from the floor that local conditions require. Third—The disc or cutter wheel can be tilted up or down by means of a hand wheel at the front end of the machine (see Fig. 1), so that

Fig. 1.—Front View of Longwall Mining Machine.

sulphur balls or other obstacles can be passed over or loosened if met with in undercutting, or on an uneven floor the irregularities can be easily followed. Fourth—The machine is designed to be operated from the front end, which enables the operator to lay his rail ahead of machine, see that the roof and face are safe before the machine approaches and leaves more room in the rear for handling rails and spragging the coal. Fifth—The feed mechanism (see Fig. 2) is

Fig. 2.—Rear View of Longwall Mining Machine.

driven by an eccentric on the outer end of the main drive shaft at the rear through a ratchet and pawl to a winding drum located on the front end, giving the operator ability to start, stop or change the rate of feed at will without stopping the engine. The rates of feed that are possible are 8", 15" and 21" per minute. Sixth—The machine is constructed of steel throughout, with the exception of the engines, which are of cast iron. The engines are 9x8-inch cylinders, designed to develop 25 H. P. with 40 pounds of air at the machine, and are provided with cast steel crossheads connecting rods and crank discs. It is claimed that under favorable conditions this machine will cut from 600 to 800 lineal feet face per day. Further information will be given interested parties by the manufacturers.

THE Wm. P. Miller cyanide process (patented) consists essentially in dividing or separating the coarser material from the slimes, and collecting the slimes in cakes by expressing the waters by means of a filter press. The press is then opened and the compressed slimes containing gold and silver drop into an agitating vat or vessel in which is introduced a solution of cyanide of potassium in the desired quantity and requisite strength, forming a pulp. The mass is continuously agitated by machine power to bring the particles of matter or material in contact with the cyanide solvent. The gold and silver pass into solution as gold and silver cyanide solution. The contents of the agitating vat or vessel are then forced through a filter press. The intent is that the gold and silver cyanide solution shall leave the press as a clear liquor. It is then run into cells or vessels in which the gold and silver are to be precipitated by zinc or other process of recovery. The residue remaining in the press is then washed by forcing water through with the object of freeing it of any remaining cyanide gold and silver solution, and reconveyed into a receptacle to be strengthened for further use.

#### A Cement Casing for Oil Wells.

In a paper read before the Baku Technical Society, by S. Trop, the following remarks are made concerning the use of cement in protecting petroleum wells from water:

In every petroliferous bore hole two directly opposite forces are in action—that coming from below upwards, the pressure of the oil column, and that from the top downwards, the column of water formed by water constantly forcing its way through the pipes from the outside. When the flow of petroleum and the pressure of gases are stronger than that of the water in the well, the latter is forcibly ejected, and the bore fills with oil, and there is little difficulty in exploiting the petroliferous strata. But when the reverse is the case, and the pressure of petroleum is less than that of the water, this latter forces the oil

back, prevents its rising in the bore hole and interferes with the exploitation work, which is only possible when the bore hole is isolated from the surrounding water-containing strata. At the present time, owing to the exhaustion of part of the petroliferous strata of the Apscheron Peninsula, and also to the petroleum gases which find a free exit through the wells already in existence, the pressure in the petroliferous strata has been considerably dimin-

ished, and in many places it is only possible to obtain an abundant flow of oil after the careful isolation of the bores from water has been effected. It is therefore not surprising that the question of the methods of isolating petroleum wells from water has lately occupied the first place among questions relating to boring engineering. The method generally adopted in the work has been by introducing a filling of Portland cement.

This cement, mixed with water, is poured into the interstices between the two columns of casing, where it becomes solidified, and forms a waterproof covering which prevents the water from penetrating into the well. The methods adopted in this instance are well known, and it is only necessary to mention that the difference in the diameter of the two columns, between which the cement is inserted, must not be less than 4 inches. For this purpose, as is well known, one strip of casing is cut out and removed from the bore at a depth of from 35 to 40 feet above that inserted last. Where it is possible to insert a filling of cement, it is undoubtedly the most convenient and cheapest method. This cement wall lining the inside of the bore hole serves the two-fold purpose of keeping the water out of the well, and practically removing the downward pressure of the water.

In many cases where the strata surrounding the core are pervious, the water sinks down through them and helps to force the oil up through the bore hole. Cement in such a position does not set readily, and great care should be exercised in adding the proper amount of water and allowing plenty of time to elapse before the pump is started for the cement to harden. When the casing is once properly set, it forms the most durable method of lining a bore hole that has ever been tried.

RUSSIA has levied a 30% increased duty on American machinery, steel and iron goods.

## The Manufacture of Uranium Compounds.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. OHLY.

The only minerals deserving consideration under this head are carnotite and uraninite or pitchblende, which occur in sufficient quantities in nature to allow of commercial treatment. The first named is to be considered as a potassium-sodium vanadate of the composition  $K_2UO_4NaVO_3$ , and the second consists of a mixture of the two oxides  $UO_2, 2U_3=U_3O_8$ . Both of them are frequently contaminated with foreign admixtures, among them pyrite, which is often found associated with pitchblende, and a number of other metallic compounds, which usually accompany carnotite, as shown by the analysis of the latter given below. Uraninite is known to occur, and has been mined in the Wood mine and German lode of Gilpin county, Colorado, while carnotite has been located in commercial quantities only in Paradox valley, Montrose county, of the same State, near its southwestern boundary and that of Utah. There are, however, indications showing that deposits of carnotite and pitchblende will soon be located in other States, since the writer is in possession of information from mining men in California, Washington and New Mexico, which are of a very promising nature.

The great drawback, however, in the locating of further deposits of this kind consists in the circumstance that but very few of the miners and prospectors outside of Colorado have had an occasion to study the characteristics of the minerals under consideration, since these men usually live at great distances from localities where mineralogical collections are kept for public inspection, and are consequently handicapped in their investigations by the impossibility of obtaining a thorough knowledge of these bodies. The eagerness of this class of people to post themselves in this regard is, however, remarkable and praiseworthy, and, in cases of this kind, the writer has often taken occasion to forward samples and information in the expectation that the connection thus established might lead to further locations of yet unknown deposits. In connection with these remarks, the writer can not refrain from stating that this expectation has been quite recently realized (and, in fact, while he was sketching the present article) by the receipt of a package containing a sample of real carnotite from Inyo county, California.

It is very deplorable, however, when considering these facts, that no State or Government institution has as yet been established with a view of furthering the mining interests of the United States by sending out small samples of valuable and little known minerals for the purpose of enabling miners and prospectors to study and fix their characteristics, so as to assist them thereby in the discovery of new deposits. Perhaps the problem could be brought to a speedy solution in a similar manner in which the advancement of the agricultural interests of the country has been accomplished—that is, by inducing representatives of the mining States of the Union to forward samples of this kind on application. Since the acquisition and storage of a few hundred pounds of each of these minerals requires but a very limited outlay, and the amount of ore mentioned is sufficient to supply all prospective applicants, when subdivided into a few ounces each, the benefits accruing to miners and prospectors will be almost incalculable, when considering the possibilities which must necessarily arise in the wake of such succor.

Returning after this pardonable deviation to our subject, it must be borne in mind that according to the investigations made by the Government chemist, Mr. Hillebrand, which were published in the issue of the MINING AND SCIENTIFIC PRESS of August 25, 1900, the treatment of carnotite by dilute acids does not result in a complete decomposition of the mineral. To facilitate matters for the reader, however, and in order to present the points under consideration in one cast, we will repeat below the analytical results obtained by Mr. Hillebrand in part:

### U. S. GEOLOGICAL SURVEY—REPORT OF ANALYSIS. CARNOTITE, ROCK CREEK, NEAR PARADOX, MONTROSE COUNTY, COLO.

| SOLUBLE IN DILUTE ACIDS. |           |
|--------------------------|-----------|
| $UO_3$ .....             | 52.25     |
| $V_2O_5$ .....           | 18.35     |
| $K_2O$ .....             | 6.73      |
| $Na_2O$ .....            | .09       |
| $Li_2O$ .....            | None      |
| $CaO$ .....              | 2.85      |
| $BaO$ .....              | .72       |
| $MgO$ .....              | .20       |
| $PbO$ .....              | .25       |
| $CuO$ .....              | .20       |
| $Fe_2O_3$ .....          | 1.77      |
| $Al_2O_3$ .....          | 1.08 app. |
| $TiO_2$ .....            | .10       |

Diagram Showing the Surveyed and Unsurveyed Area of Western States and Territories.—(See page 121.)

### INSOLUBLE PARTS.

|                        |       |
|------------------------|-------|
| $SiO_2$ .....          | 5.18  |
| $TiO_2$ .....          | 1.15  |
| $Al_2O_3$ .....        | .09   |
| $P_2O_5$ .....         | .26   |
| $V_2O_5$ .....         | .26   |
| $K_2O$ .....           | .04   |
| $Na_2O$ .....          | Trace |
| $Li_2O$ .....          | Trace |
| $Cr_2O_3$ .....        | .56   |
| $H_2O 150^\circ$ ..... | .32   |
| $H_2O 312^\circ$ ..... | .48   |
| $H_2O$ redness.....    | 8.34  |

A closer examination of these data will reveal the fact that the large percentage of uranium in this high-grade ore was completely extracted by means of the dilute acids employed, and that most of the vanadium values contained in the ore entered into the solution, excepting a small fraction of 0.26% of vanadium pentoxide, representing a loss of 5.2 pounds for the short ton. It might appear, therefore, that, in case it is intended to treat an ore of this class for its uranium contents alone, this purpose might be accomplished by bringing the mineral into solution through the addition of dilute nitric acid, for example, and the subsequent heating of the mixture. The high price of the former, and the necessity of employing an excess of it, which must be largely oversaturated subsequently by the addition of sodium carbonate, so as to keep the uranium in solution—an operation which is to be followed by the boiling, filtering and final precipitation of the uranium compound in solution through caustic potash, soda or ammonia—contribute, however, to render this process very expensive, and hence of little commercial value.

Among the other acids which might find application instead, sulphuric and hydrochloric (muriatic) acids are worthy of consideration, since both of them are less expensive than nitric, and can be procured to advantage in almost any locality of the country. The first acid mentioned is, furthermore, known among chemists as the most energetic, while the second shows a quite remarkable affinity for the vanadium present in carnotite, so that on its addition to a sample of the same the blood-red coloration of the chloride in solution becomes immediately apparent. Either of these two acids is, therefore, to be preferred to nitric acid in the commercial extraction of the mineral carnotite, while pitchblende requires a somewhat different treatment, as will become apparent from the communications following.

The carnotite having been brought into solution in the manner indicated, the values of uranium are precipitated from the liquid by the addition of caustic soda, where a compound containing sodium uranate to about 23%, besides iron, alumina and lime, results, which is washed with water, dried, pressed into bricks and sent in that form to brokers in New York, who attend to its transportation to Germany, where the uranium values are extracted, and the product is refined to the oxide  $U_3O_8$ , or to the hydrated sodium salt of varying composition. It would, of course, be much more profitable to refine the material operated on in place, so as to produce either the sodium salt or the oxide in a state of approximate purity, but, to judge from existing conditions, the process for the manufacture of these articles on a paying basis has not been brought to perfection as yet, so that the production of the crude compound forms unto the present the only alternative to be chosen.

Though the foregoing statement is a truthful one, and can be verified by actual facts, there cannot be any doubt but that continued research will develop a method sufficiently inexpensive to allow of the commercial manufacture of the uranium oxide and sodium salt. Not only will this be accomplished in the near future, but the ready and cheap separation of vanadium from uranium, and the preparation of almost chemically pure oxides of the two metals at moderate expense will soon be an accomplished fact, so that the realization of the points considered is merely a question of time.

To prevent, however, a wrong impression being formed as to the usual percentage of uranium in the ores occurring at the mines, it must be known that the average values of uranium oxide in them seldom surpasses the figure 6, while the mineral analyzed by Mr. Hillebrand is to be considered as a picked sample of extraordinary fineness. A perusal of analyses made by the writer on average samples from the various claims in Paradox valley will make this point more clear, and it will be realized then that under

prevailing conditions low-grade ores of this kind are not apt to bear transportation, and should, therefore, be concentrated or refined in place. Hence the erection of a mill in localities of such character as to allow of the manufacture of the uranium compound mentioned for several years appears to be the proper plan, though shipments to European ports of high-grade uranium ores have been made to advantage in former years.

(TO BE CONTINUED.)

### Internal Corrosion of Wire Ropes.

Thos. G. Lees, in the Transactions of the Federated Institution of Mining Engineers, says:

"Corrosion as applied to wire ropes means a gradual eating away of the substance of the wire, the metal being converted into oxide of iron, etc. It is entirely distinct from abrasion and cannot be mistaken for it. Shaft waters differ greatly in composition, some being very harmless and others very corrosive, but the best of them in connection with air may cause corrosion.

"There are various stages of corrosion, beginning with a very slight pitting which is scarcely perceptible, but if disregarded the wire soon becomes very much reduced in strength. If the bright surface of the wire is pitted it has been found that a great part of its strength has been lost. This peculiar action has in the past not been fully recognized and failure has often been attributed to the inferiority of the wire. It is usually due to the action of moisture in the form of steam or water alone, or with the addition of furnace gases.

"There are three points in a winding rope where it has been found from experience that corrosion usually takes place, first, at the cap end of the rope; second, where the ropes rest on the pulley when the cages are at the top and bottom respectively; and third, on the underlapping rope at the drum. At the second and third of these points, the strands of the ropes are opened more or less, due to the bending over the pulleys and under the drum, thus allowing water to enter more easily at these points than at other parts of the rope, but it is at the cap end that the wires suffer most, and this is probably due to the fact that every time the cages settle on the props or keep at the pit top and at the pit bottom, a certain amount of slack rope allows freedom of motion for the wires to untwist and bend, and thus the strands open somewhat and allow the water to percolate into the inside of the rope.

"If all the failures of winding ropes could be ascertained, it would be found that by far the greater number occur within a few feet of the cap from a variety of causes, and not necessarily from corrosion alone. Owing to many of the accidents causing no loss of life or personal injury, official records are not obtainable. In the opinion of the writer, the only practical way of dealing with this part of the rope is periodically to cut off a few feet and recap the rope. It is hardly necessary to give the advantages of a systematic recapping of ropes, but the two most important are: 1. By cutting off a few feet of the rope the inside strands can be thoroughly examined and treated, and, if found in good order, the cap may be put on again. 2. Letting out the rope from the drum to replace the length cut off, changes the position of the pulleys where the greater strain has to be taken when lifting from the bottom. It is advisable under ordinary circumstances to cut off about 12 feet from each rope.

"The operation is simply this: One rope, after being recapped, is lowered by the engine man and attached to the cage, and this causes the other rope to be 24 feet too short, so that it has to be let out from the spare rope provided and kept coiled around the inside of the drum. Thus each rope is allowed 12 and 24 feet alternately at each recapping. Sufficient spare rope is allowed for in ordering a new rope to provide for recapping, in addition to the two rounds of rope which must be left on the drum. In sinking shafts it may be an advantage to cut off a greater length than in ordinary cases of winding ropes, as the ropes are subject to more bending and twisting near the cap end, and to varying strains in addition to the corrosive action of the water.

"This corrosion takes place even when the rope is thoroughly lubricated, and the lubricant on the outside may cover up flaws and deceive the inspector of the ropes, and it is impossible by the usual system of outward inspection to discover the internal condition of the rope. The old hempen core ropes were par-

ticularly subject to corrosion, but the efforts to overcome it in the wire core ropes have not been entirely successful. One of the best preventives of corrosion is the galvanizing of the wires. As a result of a number of tests made by the writer, he found that a failure in strength in galvanized wire is so small as to be practically of no importance."

## Mining and Metallurgical Patents.

Patents Issued February 26, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS

ORE SEPARATOR.—No. 668,742; W. A. Redding, Macon, Ga.

Combination with downwardly convergent water vessel, one side overflow trough, perforated water compartment opposite side level of overflow, valved pipe supplying water to compartment, means for discharging material, and for producing air current between discharge point and compartment in direction of trough.

CRUCIBLE AND CRUCIBLE FURNACE.—No. 668,803; A. Reynolds, Sheffield, England.

Crucible furnace having refractory hearth, vertically extending tubular crucible with open lower end seated on hearth, removable refractory plug extending through hearth beneath crucible having tapping hole, supporting plate for plug, closure for lower end of tapping hole.

PROCESS OF MANUFACTURING ZINC AMALGAM PLATES.—No. 669,007; G. T. Eyanson and A. J. Shinn, Philadelphia, Pa.

Of making battery plates, process consisting in placing amalgam of zinc with supporting grid in mold, subjecting same to pressure, applying heat to mold and to amalgam during operation.

APPARATUS FOR ELECTROLYTICALLY EXTRACTING AND DEPOSITING GOLD AND SILVER FROM THEIR ORES.—No. 668,842; A. M. Rouse, Denver, Colo.

Combination of series of tubs, anodes and cathodes arranged therein, agitation tube having communication with tubs at upper and lower ends, agitator in tube having means by which ore pulp to be treated

may be elevated therein, perforated conduits located in upper ends of tubs adapted to receive ore pulp from tube and discharge it into tubs.

AMALGAMATOR.—No. 668,643; T. H. Hicks, Fort Wayne, Ind.

Apparatus for mercurializing ore, combination of retort to contain ore and mercury, means for vaporizing mercury, adjustable pipe extending into retort to empty retort of contents, retort provided with opening for admission of air, suction mechanism connected to adjustable pipe, for emptying retort of its mercury and ore, water condensing tank for collecting mercury and ore, condensing tank provided with outlet pipe for escape of air taken into retort by suction mechanism while emptying.

DESULPHURIZING COPPER MATTE.—No. 668,952; G. C. Carson, Castella, Cal.

In combination with pot for receiving molten metal, flexible hose for conveying air, in combination with rigid extension thereof having coil, adapted to be inserted into pot and metal contained therein, coil being arranged over pot.

CONCENTRATOR.—No. 669,038; S. W. Traylor, Denver, Colo.

Combination of vibratory concentrating table having opening at rear extremity, screen covering opening and adapted to receive concentrates from concentrating surface table, chamber mounted on table below screen opening, stationary reservoir suitably located with reference to table, conduit connecting reservoir with chamber on table, arranged to permit movement of table, plunger located in reservoir, suitable means for simultaneously imparting necessary movement to table and reciprocating movement to plunger, whereby pulsations are imparted to water in chamber causing it to pass up and down through screen.

ORE CONCENTRATOR.—No. 668,980; C. A. Christensen, Oretown, Or.

Ore concentrator plan having sides flared outward, bottom formed of integral sheet bent into straight, transverse, parallel ridges and grooves forming riffles, having series of holes in each riffle, triangular baffle plates arranged oppositely, in pairs, set vertically parallel with riffles, extending from sides inward toward each other.

ELECTRIC AMALGAMATOR.—No. 669,058; L. H. Barricks, San Francisco, Cal.

Combination of inclined plane, supports attached thereto carrying upon horizontal edges vertically partitioned amalgamating trough forming two cells, one adapted to contain saline solution, other mercury, one cell having extended shallow end, vertical extensions of supports or brackets above trough, journal boxes adjustably fitted thereto, sluice box having journals near one end fitting journal boxes, means for adjusting incline of sluice box, metal plate within projecting beyond sluice box, dipping into mercury containing cell, plate forming cathode electrically connected with anode within solution containing cell through porous partition and contacting fluids.

CONCENTRATING APPARATUS.—No. 669,043; A. K. Cross, Denver, Colo.

In concentrator, combination with suitable frame, of table mounted thereon composed of flat strips having their adjacent side edges in contact, separated transverse wires or rods with which strips are interwoven to form cells having side openings, but no vertical outlet, means for imparting vibratory movement to table at right angles to length of longitudinal strips.

### Fuller's Earth.

Fuller's earth, which contains a large amount of silica, often as high as 70%, is the name given to that earth or clay which is capable of absorbing from newly made cloth the oil which has been used to render the wool pliable in weaving, or fulling. This constitutes its chief characteristic. Hence the physical properties rather than any chemical composition constitutes a fuller's earth, and these properties should be as follows: A soapy feel, showing it capable of absorbing grease and oils; fine texture, with no grit that could injure the cloth in rubbing; should crumble easily in water and mix readily with it. Unlike most clays, it exfoliates when burned, and hence cannot be used in making bricks.

Among its many uses may be mentioned its employment for filtering mineral oils instead of lampblack, and to some extent for lightening the color of cottonseed oil, although for the latter and for vegetable oils generally the English earth is still preferable. The crude black mineral oil is allowed to percolate slowly through the dry, finely ground earth placed in cylinders, whence it issues quite white in color, and at first somewhat thinner. The oils apparently percolate at different rates, according to their densities, and it is suggested to make use of this fact for the fractional separation of crude oils into their various qualities, instead of distilling.

Fuller's earth generally occurs in large, shallow basins in swampy tracts. Below the 1 or 2 feet of surface soil is a layer of mottled plastic clay 2 to 6 feet thick, and then the fuller's earth in layers from 2 to 12 feet thick above a bed of sand. After being dug out it is allowed to dry in the sun for several days, losing 50% of its weight and turning from a greenish color to a creamy white.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

The recent decision of Judge Brown of the U. S. District Court of Alaska, in which he held that Port Valdes should be the recording town of Cook Inlet and other mining districts in that section, is strongly opposed by the miners in that region, as it will now require a trip of 500 miles to record. Heretofore recording has been done in the heart of the camp on Turnagain Arm. A petition, praying for a resident recorder, is circulated.—A similar decision, rendered by Judge Wickersham of the Yukon district, ruling that miners of the Koyukuk should record at Eagle City, hundreds of miles distant, is also meeting with opposition.—One thousand sacks of ore were recently shipped from the White Eagle group at Ketchikan.—The Industrial Co., J. M. Scott manager, has fifty men working on its property on Copper Inlet, Prince of Wales island.—Work will resume at the Copper Mountain.—The Last Chance M. Co. will begin operations on its property, in the Porcupine district, this spring.

## ARIZONA.

### COCHISE COUNTY.

The Toughnut, at Tombstone, is producing ore.

### GILA COUNTY.

The crosscut tunnel on the Wild & Woolly, north of Globe, is expected to cut the vein at a depth of 125 feet.—The shaft on the Tip Top No. 1, same locality, is down over 100 feet.—J. Henry has leased the Big Johnnie, 2 miles north of Globe, and will begin work on same immediately.—The Copper Hill group is reported sold to a Boston company.

### MARICOPA COUNTY.

The Pacific Petroleum Co., Ltd., capital \$300,000, is incorporated at Phoenix.

### MOHAVE COUNTY.

C. D. Pickering is pushing work on the San Francisco at Cedar.—At Cerbat J. Barry will start work on the St. Louis. M. McCorkle will erect a custom mill in the San Francisco district.

At Chloride the Tennessee mill is ready to start; oil will be used as fuel.—A strike is reported on the Lucky Girl, near Chloride. Ore is said to run 1000 ounces silver to the ton.—A. L. McKesson is operating an arrastra at White Hills.

There are 200 men employed in the mines at Chloride.—A body of good ore is opened up in the Elkhart, at Chloride.—The new hoist at the Empire is in place.

J. Buckhard of Los Angeles, Cal., has twenty men working on his property in Gold Road district, near Kingman.—The main shaft on the Tennessee is down 500 feet. Forty-eight men are employed.—The shaft on the Pinkham, near Chloride, is down 220 feet.—The Empire, Chloride, is now using oil as fuel.—Fisher & Flynn will sink the shaft on the New Jersey, near Chloride, an additional 200 feet. A new 1500-foot shaft will be started on the Elkhart, near Chloride; Supt. and General Manager Comstock.

### PIMA COUNTY.

A body of good ore is opened in the Harrisburg, in Black Rock district, near Florence.

### YAVAPAI COUNTY.

The Vulture, near Phoenix, is sold to W. B. Troy and others of New York, who will put in new machinery and develop the property on a large scale.

## CALIFORNIA.

### AMADOR COUNTY.

Capt. Glenn is operating his hydraulic mine near Volcano.

### BUTTE COUNTY.

One hundred and sixty acres of land near Honcut are bonded to a dredger company.—The Keystone driller now operating near Smartsville will be brought to Honcut and operated on land near there. Should tests prove satisfactory, a dredger will be put in.

### CALAVERAS COUNTY.

The Central Hill Gravel M. Co. has resumed operations on its property near Murphys.—There are 100 tons of ore at the Rose Rock, on Indian creek, near Murphys, awaiting transportation to the Heinsdorf mill at that place.—The May Day M. Co. has suspended operations in its tunnel.—The engine from the south shaft of the Angels, at Angels, is going in on the main shaft; it has a capacity of working to a depth of 1000 feet; shaft will be sunk an additional 200 feet.—J. G. Black, of Duneden, New Zealand, is making experiments with his new process for extracting gold from sulphurets without the use of chlorine gas at the Lightner

plant at Angels.—There is \$171,496 worth of ore computed to be in sight at the Seminole, near Carters.—The Zeile, at Jackson, recently closed down owing to a break in the hoisting machinery, etc., has resumed operations.—The new tank at the Kirkwood, Jackson, is completed and sinking is resumed.—A 12-foot vein of good milling ore is reported on the 600-foot level of the Shenadoah, at Plymouth. 500 feet south of the present shaft; Supt. Thornton will run an upraise from this point to the surface and sink a working shaft there.—The bond on the Saint Lawrence (the Brunner), at Albany Flat, is forfeited.—Vance & Mobley Bros. will sink the shaft on their property in Bear gulch, near Jenny Lind, now down 90 feet, to the 300-foot level.—A body of good ore is opened up in the Hoover & Voight, in Bear gulch, at a depth of 40 feet.—The Golden Eagle, near Jenny Lind, is bonded to Angels parties; work will begin shortly.—The old Alex, at Rich gulch, which has lain idle for thirteen years, is being reopened by J. O. Stewart.—Reports from Sheep Ranch state that the mine and mill at that place will start up again.—Operations on the San Justo, on Carson creek, near Angels, which was recently flooded with water, may be resumed soon; a new shaft will be sunk farther down the creek.

In the issue of the 16th ult. the Lightner chlorination plant at Angels was reported closed down. This was a mistake, as the same has been in continuous operation since the middle of last December, as have also the mine and mill.

### EL DORADO COUNTY.

The old Spreckels, near Fairplay, has resumed operations. Ten men are employed.—The mill at the St. Clair, near Kelsey, is running steadily, crushing fifteen tons of ore daily.—Brown Bros. are pushing work on the Mt. Pleasant at Grizzly Flat. Thirty men are employed.

W. Rhinbold is sinking a 160-foot shaft on property near Garden Valley.—Supt. J. Sipp is pushing work on the Atlanta, east of Spanish Flat.—Work is in progress on the Em, near Kelsey.

### INYO COUNTY.

A 100-ton concentrating plant will go in at the Reddy mines, near Darwin, this spring; C. D. Rookledge, manager.

### KERN COUNTY.

At Ludlow the Barstow mill is now running.—The Red Dog mill is running on ore from Mojave. A recent run of the mill on 50½ tons of ore from the Butte, near Randsburg, Supt. McMahon, returned two bars of bullion, aggregating \$4525.—The Black Mt. Oil Co., capital \$500,000, is incorporated at Randsburg, to work 1440 acres land near there.—The Monte Cristo Oil Co., operating in the Kern river field, has begun the erection of a 30,000-barrel storage tank near Kern City.—The Junction Oil Co. has put up a derrick on well No. 5; wells Nos. 3 and 4 are producing 400 barrels oil per day. Five wells of the California Standard Oil Co. are now producing 400 barrels oil per day.

### MARIPOSA COUNTY.

The Hite Cove M. Co. is pushing work on its property, near Cove; mine is unwatered. The new cyanide plant is running smoothly and 33,000 tons of tailings will be treated; thirty-five men are employed.—The Mariposa mill, at Mariposa, is running steadily.

The new mill going in near Mariposa is completed.—Mining operations are in progress near Princeton and Bear Valley.

### MONO COUNTY.

At Jordan, part of the works at the Castle Peak are shut down owing to scarcity of water.

### NEVADA COUNTY.

A sand plant will be erected at the Mountaineer, near Nevada City, to save slimes for reworking on the concentrators.—At the Campbell, Nevada City, will be built a new 10-stamp mill.—The new machinery for the Canfield (formerly the old Mistletoe), near Rough & Ready, is about placed; Supt. C. Graham.

The suits between the Pennsylvania and Grass Valley Exploration companies, Grass Valley, have been set for trial in the United States Circuit Court for the Ninth Circuit, in San Francisco, on April 16. Both are for damages and trespass, each company claiming the ground upon which the other has been working. The Grass Valley Exploration Co., owning the W. Y. O. D., sues for \$100,000 from the Pennsylvania; the Pennsylvania sues for \$600,000 from the W. Y. O. D.

### PLACER COUNTY.

The Big Gun, at Michigan Bluff, is running steadily.

The Bob Lewis No. 2 (gravel), near Colfax, comprising the blue channel between the Hidden Treasure and Red Point mines, is sold to H. M. Jarvis, representing a Philadelphia company, for \$20,000; new owners will run a tunnel to tap the

channel from Drummond canyon.—J. Giles, representing Oakland men, is running a tunnel on property on the North Fork, southeast of Cisco.

Work is progressing satisfactorily on the Paragon, at Bath.—Three shafts are sunk on the Three Stars, near Ophir, one of them being 1100 feet deep; work is begun on erection of a stamp mill; E. J. Kendall, Supt.—More men are put on at the Star, near Ophir; work is being pushed.

### PLUMAS COUNTY.

Thomas & Bunson will put in a hoisting plant on their property at Emigrant Hill, and will sink a shaft to open up a gravel channel.—A hoist will also go in on the Bushman (gravel), near Quincy, operated by Delano & Hazzard; a shaft will be sunk and mine will be worked through that, instead of through the tunnel now on the property.—Gobert & Lesher have bonded the Bushman (quartz) mine and mill, same locality. They will soon begin crushing ore now on the dump. It is stated that, if results are not satisfactory, the mill will be moved to the Crown Point, east of Quincy.—Work on the Plumas Imperial No. 2, near Quincy, will begin shortly, and it is thought that operations can be carried on until late in the year, owing to great amount of snow on the mountains.—The Portuguese company will push work on property on Mill Creek, south of Quincy, this spring.—The Jamison M. Co., operating near Johnsville, has fifty men employed.—More men will probably be put on at the Four Hills, near Quincy, and work will be pushed.

### RIVERSIDE COUNTY.

The San Jacinto Oil Co. has struck oil in its well near Moreno at a depth of 645 feet.

### SAN BERNARDINO COUNTY.

The Quartette M. Co., operating north of Blake, on the Colorado river, has its 20-stamp mill running steadily. A narrow gauge railroad is to be built from the mines to the mill; manager, B. Macready.—Operations at the Searchlight, same district, are being pushed by Manager G. M. Rose.—The Keystone, Arctic New Era, Mondanun and Annette mines are shipping ore.—T. C. Pern, operating in same district, will put in new machinery this spring.—The turquoise mine, north of Blake, is being developed.

### SAN DIEGO COUNTY.

The well of the Monarch Oil Co., near San Diego, is down 960 feet; it will be drilled to a depth of 1500 feet.—The tunnel now being driven to convey water from Santa Ysabel creek to the placers in Hatfield canyon, near Ramona, now in 1300 feet, will be run an additional 300 feet.

### SAN LUIS OBISPO COUNTY.

Guild & McKeon Bros., operating the Mahoney or O'Toole (quicksilver), near Adelaide, have two benches of retort pipes running steadily.

The Karl Quicksilver M. Co. is pushing work on the Sunderland or Dubost (quicksilver), same district.—R. Scott of San Jose is building a 60-ton per day Scott furnace at Adelaide.

### SHASTA COUNTY.

The first roast of ore at the new smelter at Bully Hill, near Redding, consisting of eighteen tons, was roasted last week.

The Utah & California Oil & Dev. Co. of Salt Lake, Utah, is incorporated at Redding, to work Kerosene Flats, 4 miles from Ono.—The Phoenix Land & Oil Co., capital \$11,000, is incorporated, to work 2000 acres patented land in Stinking Canyon, Sand Flats and Ono districts.

The suit of the Balaklala M. Co. vs. the Iron Mountain Investment Co. has been set for trial for March 21 before a jury. The suit is to quiet title to the Balaklala mine and for \$25,000 damages.

### SIERRA COUNTY.

York Bros. & Hart, who have been operating the Bald Mountain Extension, near Downieville, have suspended operations owing to severe weather.

### SISKIYOU COUNTY.

Mining operations are in progress in and around the Salmon river section, near Yreka, water being plentiful.—A company is being formed by J. W. Downing & Co. to work property near Ash Creek, on the Klamath river.—The Kunz Flat (hydraulic), at Hamburg, on Klamath river, owned and managed by J. S. Lowden, Jr., is running steadily.

The mill at the Cherry Hill, in Cherry Creek district, is being put in shape for a run.—Operations at the Fernandez Hydraulic, same district, are under way.—All placer claims in this district are reported working.—In Gazelle district, the Dewey mill is running on Dewey ore.—More men are put on at the La Flech, in Henley district.—Preparations are under way at the Downing, same district, for the erection of a mill.—Another ditch will be constructed at the Siskiyou Hydraulic, near Callahans.—Work is

under way at the McKean.—The Jordan Placer, in Cecilville district, will start this month.

Hydraulic mining is under way on the various streams and gulches emptying into the Klamath river.

Boston capital will push work on the Black Bear mine. There are three claims—free-milling quartz ore in black slate formation—16-stamp mill complete, water power, etc. John Daggett has the management.

### TRINITY COUNTY.

Bowie & Dedrick will soon begin the erection of a mill on their claim, near Junction City.

### TUOLUMNE COUNTY.

Operations at the Philadelphia Diggings, near Columbia, will soon begin.—The old Snell, on Knights Creek, near Columbia, is being examined by J. D. Howe of San Francisco.—Operations on the Bown, near Tuttle town, are closed down; Supt. W. J. Rule.—The Li Hung Chang, in Jawbone district, near Carters, is reported sold to Barrett & McGovern of the West Side Flume & Lumber Co.—A number of men were laid off at the Dead Horse, near Carters, last week.

The 10-stamp mill on the Hope, at Sonora, is closed owing to lack of water.—The Hard Tack group, near Sonora, is reported bonded to O. A. D'Arcy of San Francisco.—Operations are under way on the Free Gold & Haley mines, 2½ miles east of Jacksonville.

### YOLO COUNTY.

Oil with a paraffine base is reported found in the foothills, near Ramsay.

## COLORADO.

### BOULDER COUNTY.

The Wood Mountain M. Co. is shipping \$100 ore from its property near Wall Street.—Ore from the Franklin, operated by same company, is said to be running from \$60 to \$250 to the ton.—The shaft on the Gold Lode, at Wall Street, is down over 100 feet; ore is said to be running \$100 to the ton.—Work is resumed on the 300-foot level of the Forest.—At the Poorman group, near Sunshine, the tunnel is in 500 feet.—Tellurium ore running from \$500 to \$1000 to the ton is reported recently opened up on the Terror, on Spencer mountain, near Eldora; Manager Shepperdson.—The Lady Grace, on Spencer mountain, is being developed by a third tunnel.

### CHAFFEE COUNTY.

The Cebolla G. M. Co. has taken over the Longfellow, in Longfellow gulch, below Salida, and will develop it. A whim is going in, men will be put on and work pushed; Supt. W. O. Parker.

### CLEAR CREEK COUNTY.

Operations are to be resumed on the Atlantic-Pacific tunnel, at Silver Plume. This tunnel was begun about 1882, and 7140 feet were driven, 5540 feet on the Atlantic slope and 1600 on the Pacific slope, when operations were suspended, leaving about 4½ miles to be driven.—The thirty-ton concentrating plant of the Silver Mountain M. Co., at Empire, will run on ore from the Gold Dirt properties on Silver mountain, near there.—Sixteen claims on Breckenridge mountain, near Empire, are bonded to R. S. Grier.—Another strike is reported made in the Smuggler shaft at Silver Plume; ore runs about 30% lead and twenty-seven ounces silver to the ton.

### DELTA COUNTY.

Work on the Dominguez (copper) at Delta is progressing.

### DOLORES COUNTY.

The Carlie lease on Nigger Baby hill, near Rico, is shipping high-grade ore.—The Atlantic Cable group, Rico, is producing 200 tons of ore daily.—Work is under way in the Miller & Poindexter tunnel, on C. H. C. Hill, near Rico.

### GILPIN COUNTY.

A new 35 H. P. boiler will go in at the Lillian, Russell district.—The January output of the Kansas-Burroughs Co., P. McCann manager, is given as 2979 tons, or 331 cords, crude ore from the Kansas and Burroughs claims, near Central City.—The Patch M. Co. is shipping ore from the Hidden Treasure and main workings of the California, on Quartz hill.—A bucket tramway is to go in from the Carr mine and Colorado Co.'s property, in Lake district, to the company's 50-stamp mill at Black Hawk.—From the Perigo at Perigo ore is being shipped to the Perigo rapid drop 30-stamp mill at that point.—The Iron City rapid drop 25-stamp mill at Black Hawk will start up again.—Drifting and stoping are under way in the 300-foot level of the Cœur d'Alene property on Academy hill, near Central City, operated by the Rapidan M. & M. Co. of Pittsburgh, Pa.—The Chicago-Carr, in Gregory district, is shipping ore regularly. Double shifts are working and the new

plant is working smoothly; B. M. Meyers manager.

#### GUNNISON COUNTY.

The East River G. M. & M. Co., operating 24 miles northeast of Gothic, near Gunnison, has opened up 4 feet of ore running 45 ounces silver and from \$8 to \$12 gold to the ton in the 280-foot lower tunnel; ore is said to be good for concentrating, and the company may put in a plant.

#### HINSDALE COUNTY.

The Champion M. Co., operating in Burrows Park, will put in a plant of machinery this spring.—A 200-foot crosscut tunnel is run on the Illinois Boy, in Burrows Park, 22 miles from Lake City, operated by W. Myers, of Ouray; main pay streak is said to be from 16 to 24 inches wide, and ore is said to carry gold, silver and copper; two cars of ore recently shipped to the Argo smelter returned \$279 per car.

#### LAKE COUNTY.

The shaft on the Vega, at Leadville, will be sunk to the 1000-foot level.

#### MONTEZUMA COUNTY.

Eighteen claims near Mancos were recently sold to J. N. Doyle and others of Denver. The new owners will begin work early in the spring.

#### PARK COUNTY.

The No End, on Mt. Cross, near Alma, is leased to W. H. Bean.—A strike of good ore is made on the Minks lease on the Champagne, Alma.—The Goldore Co. contemplate the erection of a mill near Alma this season.

#### ROUTT COUNTY.

J. A. Connell and others, operating near Steamboat Springs, have put in a pump and will push work.—The Northwestern Oil Co., whose plant was recently destroyed by an explosion, has resumed operations.

#### SAN MIGUEL COUNTY.

The Tom Boy M. Co., Manager Herron, will put in additions to its mill at Telluride this spring.—On the 23rd ult. the buildings at the mouth of the crosscut tunnel of the Japan at Telluride were destroyed by fire, as were also an electric motor and drill plant.

#### SUMMIT COUNTY.

At Kokomo, Denver men are working the Bledsoe.—Work is temporarily suspended at the Sellers, owing to matter of wages.—Progress is being made in driving the Union Con. tunnel.—The Maximus, near Kokomo, has an altitude of 12,300 feet.

#### TELLER COUNTY.

The estimated output of the mines of Cripple Creek for the month of February is given at 48,700 tons of ore, which yielded \$2,058,000 in gold bullion, as follows:

| Mills.                | Tons.  | Value.     |
|-----------------------|--------|------------|
| Colorado-Philadelphia | 9,000  | \$ 353,000 |
| Bi-Metallic           | 9,300  | 230,000    |
| Economic              | 4,000  | 120,000    |
| El Paso               | 3,000  | 75,000     |
| National              | 6,000  | 225,000    |
| Union                 | 5,500  | 150,000    |
| Smelters              | 12,500 | 875,000    |
| Miscellaneous         | .....  | 30,000     |

Totals.....48,700 \$2,058,000

During the same period there were \$181,000 paid in dividends by mines of the district.—Work is to resume on the Ollie, on Signal hill, Cripple Creek.—The Red Spruce M. Co. will put in a plant at the main shaft of the Red Spruce.

The Federal G. M. Co., Cripple Creek, is putting in three electric hoists on its property on Galena hill; a 15 H. P. hoist will go in on the Little Bess.—The bailing system recently put in at the Elkton, at Cripple Creek, to clear the mine of water in eight days, not proving a success, the company will put in duplex slinker pumps, with a capacity of 1500 gallons per minute; men are at work on the fifth and sixth levels. As soon as water is out the company will put in a twenty-five drill air compressor.—The new trolley system connecting the Gold Coin mine and the Economic mill through the Columbine tunnel at Cripple Creek is completed, and is now hauling ore.—The 5-foot vein recently opened up on the 400-foot level of the Mabel M., at Cripple Creek, has dipped out of the shaft at the 420-foot level; a crosscut will be run at a depth of 450 feet to strike it again.—At Victor, sinking is in progress on the Atlanta, the main shaft now being down over 400 feet.—A station is cut on the 100-foot level of the Little Frank S., at Victor, and shaft will be continued to a depth of 200 feet; three shifts will be employed; Supt. Swisher.

#### IDAHO.

#### ADA COUNTY.

The Seager & Coryell G. & S. M. Co. of Idaho, organized in New Jersey, has filed articles of incorporation at Boise.

#### BLAINE COUNTY.

Manager Hollister is pushing work on the Hattie Golden Star and Jumbo mines, near Hatley, and is putting in a 20-stamp mill on each of them.

#### BOISE COUNTY.

The Leviathan mill, at Pearl, recently ran on twenty tons of ore from the Dowe properties, near there.—The new roller mill of the I. X. L., at Pearl, is shut down temporarily, owing to lack of fuel.—New dredging machinery is going in near Idaho City; R. Winters, Supt.

#### OWYHEE COUNTY.

A. Buckbee, manager the Cumberland, at Silver City, reports the mine making regular shipments of bullion; at the mill the concentrating tables are removed and stamps and pans only are being used.

#### SHOSHONE COUNTY.

Five feet of high-grade concentrating ore are reported opened up in the tunnel of the Leslie, near Wallace.—The Douglas group of five claims, on Pine creek, 7 miles above Wardner, in Yreka district, is bonded to J. Goodrich of Spokane, Wash., for \$60,000. A company, to be known as the St. Paul & Idaho M. Co., will be incorporated to work the property; men are being put on and work will be pushed under Supt. P. C. Stoess.

#### WASHINGTON COUNTY.

The Black Lake M. Co., E. D. Ford manager, will do extensive work on its properties near Weiser this season.

#### MICHIGAN.

#### HOUGHTON COUNTY.

The annual report of the Baltic M. Co., Houghton, shows that during the last six months of 1900 the yield of refined copper per ton of ore crushed was 21.44 pounds. It is estimated that 1000 tons of ore will be crushed daily by the latter part of the summer.

The annual report of the Tamarack M. Co., Houghton, shows that during 1900 there were 766,058 tons of ore mined, of which 625,422 tons were crushed. Total receipts were \$3,299,077 and total expenditures were \$2,099,935, leaving a profit of \$1,199,142. Up to Dec. 31, 1900, No. 5 shaft, which was started Aug. 7, 1895, had reached a depth of over 4662 feet, and had cost, including equipment, etc., \$663,508. Total work for 1900 is given as follows:

|                                                                  | Feet. |
|------------------------------------------------------------------|-------|
| Sinking.....                                                     | 1,008 |
| Drifting on the conglomerate.....                                | 4,115 |
| Drifting on the Osceola amygdaloid tributary to No. 1 shaft..... | 1,473 |
| Crosscutting.....                                                | 2,477 |
| Total.....                                                       | 9,073 |

#### MONTANA.

#### BEAVERHEAD COUNTY.

The twentieth annual report of President and General Manager H. Knippenberg of the Hecla Con. M. Co., operating at Glendale, shows a net cash profit of \$36,471.55 for 1900.

#### CASCADE COUNTY.

A recent order of the court stopping operations at the Comanche at Great Falls threw 150 men out of employment.

#### FERGUS COUNTY.

The upper tunnel in the Mammoth, in Warm Springs district, near Gilt Edge, is in 125 feet.

#### GALLATIN COUNTY.

Ore from the Sunshine group, in Springhill district, runs 30% copper.

#### GRANITE COUNTY.

L. U. Loomis, representing New York parties, will probably begin work on properties near Philipsburg.

#### MADISON COUNTY.

The new concentrator of the Red Chief M. Co., at Red Bluff, is running.—At the Red Bluff, Red Bluff, a new 10-drill air compressor is in place; mine will be pumped out and work pushed; work on new concentrator will begin shortly.

#### MEAGHER COUNTY.

At Copper, formerly Copperopolis, 18 miles northeast of White Sulphur Springs, Supt. J. B. Gallagher is pushing work on property near there; 100 men are employed, and shaft is down 500 feet.

#### YELLOWSTONE COUNTY.

The Colorado coal mines, at Billings, Supt. T. Graham, will probably be reopened shortly.

#### NEVADA.

#### LINCOLN COUNTY.

The new 25-stamp mill at El Dorado City is completed and has started up.

#### LYON COUNTY.

The ledge in the Logan & Hulley, near Dayton, is reported to be 32 feet wide; ore is expected to run about \$10 to the ton.

#### WASHOE COUNTY.

In Olinghouse canyon, near Wadsworth, 1200 feet of work is completed in the Ora;

a 30-foot crosscut is run from a point 150 feet in the main tunnel; 300 tons of ore on upper dump are expected to return \$1500.

The deal for the sale of the old Jones and Kinkad, at Pyramid, to New York parties, is about completed; price to be paid is about \$25,000.

#### NEW MEXICO.

#### COLFAX COUNTY.

Ore recently opened up in the Bobtail and Senate mines, at Elizabethtown, operated by Pittsburgh, Pa., men, is running \$500 to the ton.

#### GRANT COUNTY.

A new furnace is going in at the reduction works at Silver City; it will be blown in about April 1st.—Operations are under way on the 160-foot level of the Wild Cat, at Santa Rita; main working shaft is being retimbered and a hoisting and pumping plant will go in soon.

#### LINCOLN COUNTY.

Work is resumed on the South Homestake, at White Oaks.—A vein of rich ore is reported struck in a drift west of the main tunnel in the Boston Boy, same district.

#### SIERRA COUNTY.

Work is in progress on the Ben Harrison No. 2, at Fairview.—A pump and hoist will go in on the May, on Monument creek, near Fairview.

#### TAOS COUNTY.

High-grade ore is reported opened up in the Shooly, on Placer creek, near Red River.

The Rio-Hondo Copper Co. will put in a 50-ton mill, preliminary to building a 100-ton mill on its property, 35 miles from Tres Piedras. The company will build an electric railroad from its mines to Tres Piedras.

#### OREGON.

#### BAKER COUNTY.

Ore from the Red Jacket, Huntington, runs from \$2 to \$60 to the ton.

New machinery is going in on the Quebec, in Red Boy district, near Sumpster.—The shaft in the Red Boy will be sunk to the 2000-foot level.

#### JACKSON COUNTY.

Perkeypile Bros. are pushing work on their property, near Gold Hill.—The Big Giant, on Sardine creek, near Gold Hill, is sold to C. R. Ray, of same place.—A strike is reported made in the Crown Point, on Blackwell hill, same district, operated by Shaffer & Herbert.

One hundred and eighty acres of land, a 5-stamp mill, water rights, etc., near Jacksonville are sold to J. W. Opp of Jacksonville for \$25,000. Mr. Opp also has an option on the Gold Standard, adjoining, upon which is a 10-stamp mill and a 500-foot tunnel. Mr. Opp will build a \$100,000 reduction plant on the Gold Standard and expects to have it in operation by July 1. The plant will include crushing rolls, concentrators and a cyanide department.

#### JOSEPHINE COUNTY.

Work is in progress on the Bone of Contention, near Williams.—Schrimpf Bros., operating near Provolt, recently took out \$400 worth of gold from a pocket in their mine.—The Baby (quartz), in Jump-off-Joe district, is bonded to Rice, Myers & Smith for one year for \$1500. Work is in progress, the lower tunnel now being extended to cut the pay shoot at greater depth. The ledge runs from 1 to 3 feet in width.—Sharp Bros., owning the Challenge and Midnight (formerly the Kiessling) mines, on the Applegate river, near Provolt, are driving a 400-foot tunnel on the Midnight. Operations on the Challenge are temporarily suspended.—Operations are now being pushed on the Harmon Green (placer) at Galice; D. Green, Supt.

#### UMATILLA COUNTY.

Returns from a recent shipment of ore from the Yellow Jacket group, near Pendleton, show ore to run from \$6 to \$20 to the ton; Williams & Dugger, owners and operators.

The White Fox G. M. Co., capital \$40,000, is incorporated at Pendleton.

#### SOUTH DAKOTA.

#### CUSTER COUNTY.

The shaft in the North Star, 9 miles northwest of Custer, now down 300 feet, will go to the 600-foot level. A 110-foot drift at this depth recently cut an 8-foot ledge of ore running \$18 gold to the ton.

#### LAWRENCE COUNTY.

Two hundred and forty acres of land adjoining the Homestake at Lead are reported sold to A. M. Stevenson of Denver, Colo., G. M. Nix of Deadwood and others for \$5,000,000. The new owners will erect stamp mills at a point 18 miles distant to treat ore from this property, which is said to run about \$60 the ton. The estimated cost of treating, including freight at 30 cents per ton, is given as from 79 to

81½ cents per ton. A company will be organized under the laws of Colorado to work the properties.—The Spearfish M. Co., operating in Ragged Top district, 12 miles east of Lead, recently made the first clean-up at its 200-ton cyanide plant, returns giving 200 ounces gold. The latter was shipped to Colorado Springs, Colo. The cost of mining the ore is given as 50 cents per ton and the cost of treatment by the cyanide plant as \$1 per ton. The company will probably enlarge the capacity of the plant to 500 tons this season.

#### PENNINGTON COUNTY.

The Joe Dollar, near Keystone, is reported sold to Chicago, Ill., and Deadwood men. The ore is said to run \$100 to the ton. The new owners will put in a whim and two Tremain mills.

#### UTAH.

The output of the mines of the State for February is given as \$2,292,450.

#### IRON COUNTY.

Another strike is reported made on the 160-foot level in the Johnny at Stateline. The ore is said to run \$300 to the ton.—The Ophir M. Co., Manager Eflinger, will soon begin work on its new 100-ton mill.

#### JUAB COUNTY.

The shaft on the Shoshone Bonanza at Diamond, Tintic district, is down 575 feet. Crosscutting is under way on that level; Supt. Carruthers.—The Ridge & Valley M. Co. shaft at Tintic, now down 800 feet, will go to the 850-foot level, when a crosscut will be run.

#### PIUTE COUNTY.

H. Noyes has begun work on his properties near Marysville.

#### SALT LAKE COUNTY.

The vein on the Jersey Blue, near Bingham, operated by the Bingham & Eastern M. Co., is opened at the 1380-foot mark in the tunnel. The company will build a concentrator.

During the first month's run the new smelter of the Bingham C. & G. M. Co. at Bingham treated 4200 tons of crude ore, from which 800 tons of high-grade copper, gold and silver matte were produced and shipped to Salt Lake.—During February the Highland Boy smelter at Bingham shipped thirteen carloads of copper, gold and silver bullion to Eastern refineries. Way bills show shipments to have been 781,950 pounds, valued at \$195,487.50.—The West Mono M. Co., capital \$10,000, is incorporated at Salt Lake.—The Highland Boy at Bingham is now shipping 500 tons of ore daily. The new smelter is running smoothly under Supt. White.

#### SUMMIT COUNTY.

The Valeo of Park City has contracted to ship 7000 tons of ore to the Bingham smelter.

#### TOOELE COUNTY.

The tunnel in the New Moon, in Skull valley, near Grantsville, is in 600 feet. The ore runs \$12.20 gold to the ton.

#### UTAH COUNTY.

The old Mercur mill at Manning will handle the tailings at that mine. It has a capacity of 500 tons per day.

#### WEBER COUNTY.

The Carbonate Hill M. Co. will begin work on a new concentrator on its property near Ogden.

#### WASHINGTON.

#### FERRY COUNTY.

The Republic Con. M. Co. will put in a 10-drill air compressor, a 60 H. P. hoist and an 80 H. P. boiler on the Republic Consolidated, at Republic; hoist is a geared friction plant, with a capacity of 800 feet depth, and a speed of 500 feet per minute, and it will carry a two-ton load; machinery is expected to be in place within two months.

#### LINCOLN COUNTY.

The Pennsylvania, north of Davenport, now closed down, may resume operations shortly; the shaft on the property is down 75 feet.—B. L. Worts will run a 3000-foot tunnel on property northeast of the Pennsylvania.

#### OKANOGAN COUNTY.

Operations on the Nickle Plate, on Nickle Plate mountain, on Twenty-mile creek, near Hedley City, 70 miles north of Loomis, are being pushed by Supt. Rogers; forty men are employed, and air compressor is going in; mine has an elevation of 6650 feet.—It is stated that Wallaston & Bendell, owning the Horsely, near Hedley City, will spend \$20,000 in development, equipment, etc., on the property this summer.—The Princeton, Hedley City, is bonded to L. L. Patrick.

#### FOREIGN.

#### BRITISH COLUMBIA.

The first shipment of 250 tons of ore from the Rossland-Great Western, at

Roseland, since its purchase by the British America Corporation, was made on the 25th ult. to the smelter.—W. H. Sandford of the Bosun M. Co., Ltd., operating the Bosun group of six claims near New Denver states that the tunnel on the sixth, or lower level, has cut the ledge; ore is silver-lead and averages \$100 to the ton.

The report of Manager J. B. Hobson of the Con. Cariboo H. M. Co., Bullion, B. C., Cariboo district, shows that during 1900 the mine was operated 171½ days with from 2500 to 2750 miners' inches of water. The first run was from April 4 to July 1; 170,753 miners' inches washed out 791,899 cubic yards gravel, yielding 7867 ounces gold, valued at \$134,728.45, an average yield of 17 cents per cubic yard, the duty of the water attained being 4.63 cubic yards gravel per miners' inch. The second run was from July 2 to Sept. 30, when 188,375 miners' inches washed out 751,000 cubic yards gravel and top clay, from which was recovered 9058 ounces gold, valued at \$154,848.41, an average yield of 20.61 cents per cubic yard. The duty of the water attained during that run was 3.98 cubic yards gravel per miners' inch. The third run was from Oct. 1 to Nov. 9, when 101,750 miners' inches water caved and washed out 301,039 cubic yards top clay and gravel, recovering 3544½ ounces gold, valued at \$60,508.91, an average yield of 20.1 cents per cubic yard. The duty of the water attained was 2.95 cubic yards per miners' inch. The receipts for 1900 were \$353,146.07, the expenses \$151,181.72. Manager Hobson figures that in 1901, "assuming that the clay capping will be successfully bank blasted and no accident occurs to interfere with the continuous operation of the mine, the operating expenses should not exceed about 6 cents per cubic yard of gravel washed."

At Silverton, a strike is reported made in the Hewitt in a crosscut from No. 3 tunnel at a point 50 feet from footwall of vein.—The Prescott, Silverton, is reported bonded; fifty men will be employed.—The Mission property, at Kamloops, is sold for \$6000 for a smelter site.—It is reported that the Iron Mask M. Co. has bought a smelter site near the head of Kamloops lake.—The tunnel on the Black Warrior group, Lardeau, now in 210 feet, will probably strike the ore chute at a point 70 feet farther in.—There are 800 tons of ore awaiting shipment at the Whitewater, Slocan.

The present capacity and increase proposed for the smelters of Yale and Kootenay is as follows:

|                 | Present Capacity. | Proposed Increase. |
|-----------------|-------------------|--------------------|
| Trail           | 800               | 1,500              |
| Grand Forks     | 600               | 1,200              |
| Nelson          | 300               | 300                |
| Greenwood       | 300               | 1,000              |
| Pyritic Smelter | 250               | 250                |
| Northport       | 1,200             | 1,800              |
| Totals          | 3,450             | 6,050              |

The Rockland, about 4 miles south of Silverton, will be reopened.

Smelters at Greenwood and other towns in Kootenay are shutting down for lack of coal and coke. They have been getting both from the Crow's Nest Pass coal fields, but a shortage in both fields now exists in consequence of the passing of the control of the Crow's Nest coal mines to an American syndicate headed by James J. Hill. Hill's syndicate has paid \$60 per share for a controlling interest in the Crow's Nest Coal Co. The management of the most important coal fields in western Canada thus passes from Canadian to American hands. A large part of the output will be used on the Great Northern lines in Montana and supplied smelters at Great Falls, Anaconda and as far south as Omaha.

#### MEXICO.

The Zapoteca M. Co., Ltd., is pushing work on its property at Zaveleta, 15 miles southwest of the city of Oaxaca, State of same name.—A 10-stamp mill will go in at San Miguel Peras, 30 miles from Oaxaca.—A 5-stamp mill is completed at the Montana mines, 5 miles north of Peras.

Work is progressing on the San Francisco, in Tavihe district, Oaxaca.—The Oaxaca M. & M. Co. of St. Louis, Mo., will put in a mill on its property in the same district.—Near Santa Catarina Minas work is in progress on the Natividad del Valle, in San Jose district.—The Conejo Colorado M. Co. of St. Louis, Mo., has bought thirty-four pertenencias in the Ocotlan district, Oaxaca, and will put in a mill, capacity twenty-five tons per day. The Moctezuma Copper Co., operating at Nacosari, Sonora, operates its plant with eight 40 H. P. gas engines. The company has its own gas plant on the ground, using eight tons of coal daily for making gas.—The new mills of the Calumet & Hecla M. Co. of Boston, Mass., on the Fernando properties at Durango, Sonora, are running. They are operated

by electricity and have a capacity of 150 tons daily.

On the La Calara group, at Wuensch, 35 miles from Magdalena, Sonora, 1000 feet of underground work will be done; a concentrating plant will be built; R. C. Bogy, of Denver, Colo., owner.

#### NEW ZEALAND.

A recent crushing of fifty-seven tons of ore at the Britannia, of the Britannia G. M. Co., near Westport, returned 123 ounces of gold.—Dredging operations are under way near Greymouth.—A recent week's run of the Waipuna dredger returned 14 ozs. gold.—The Leviathan dredger during same period returned 57 ozs. 12 dwts. of gold.

#### SOUTH AFRICA.

The new dredger for the Berim Gold Dredging Co., operating at Ashanti, is now on the way, it having been shipped recently from the Risdon Iron Works, San Francisco, Cal. The dredger weighs 100 tons. The machine was made in sections in order to be transported on mule-back to the mines.

#### THE PHILIPPINES.

Reports from the gold mining district of northern Luzon are that a find of \$2500 gold was recently made in a single pocket in Lepanto province, 175 miles north of Manila.

#### WESTERN AUSTRALIA.

The December output of Hannan's, Brown Hill, Kalgoolie, was 6541 ounces, 9 dwts. of gold from 1666 tons of sulphide ore, and 313 oz. 6 dwts. gold from tailings, making a total of 6854 ozs. 15 dwts.

#### Personal.

J. R. DELAMAR is in San Francisco.

H. A. COHEN has gone East from Redding, Cal.

O. P. POSEY of Salt Lake, Utah, is in Boston, Mass.

JAMES W. ABBOTT of Lake City, Colo., is in San Francisco.

F. THOMPSON of Salt Lake, Utah, goes to Boulder county, Colo.

V. M. CLEMENT has returned to Salt Lake, Utah, from Mexico.

W. J. SOVERNS of Grants Pass, Or., has gone to Atlin, B. C.

C. R. LUNT, Supt. 16 to 1, Washington, Cal., is in San Francisco.

W. DAVIS of the Mexican, Douglas, Alaska, goes to Tacoma, Wash.

D. E. BIGELOW of San Francisco has returned from a business trip through Mexico.

MANAGER HERRON of the Tom Boy M. Co., Telluride, Colo., has gone to London, England.

W. W. GODSMARK is now president and manager Radcliffe Con. G. M. Co., Inyo county, Cal.

SECRETARY SMITH of Red Chief M. Co. has returned to Red Bluff, Mont., from Milwaukee, Wis.

W. E. HOWELL, formerly Supt. Pilgrim, near Forest City, Cal., has returned there from Mexico.

SUPT. BISHOP of the Silver Mountain M. Co., Empire, Colo., has returned there from Boston, Mass.

A. MOORE of Downieville, Cal., has gone to South America as Supt. for an Eastern mining company.

THOMAS G. HURLEY of New York City has been re-elected first vice-president Guanajuato Con. M. & M. Co.

H. C. BACORN, Supt. Golden Sunlight M. Co., Whitehall, Mont., has resigned to become manager American M. & Dev. Co.'s plants and properties, Gibbonsville, Idaho.

#### Recently Declared Mining Dividends.

#### Obituary.

M. M. LAUGHLIN, master mechanic in the Treadwell mines, Douglas Island, Alaska, while alighting from a skip, missed his footing and fell 400 feet to the bottom of the main shaft on the 27th ult.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC AMALGAMATOR.—No. 669,058. Feb. 26, 1901. L. H. Barricks, San Francisco, Cal.; one-half assigned to J. G. Tunncliffe, same place.

This invention relates to electric amalgamators. It consists of electrolytic boxes having vertical porous partitions, forming compartments, one adapted to contain a saline solution and the other mercury, a sluice having an electrical conducting bottom dipping into the mercury compartment, a conductor within the first named compartment, journals and pins upon which the sluice is supported and means for adjusting the sluice at various inclines.

HAIR CURLERS.—No. 668,794. Feb. 26, 1901. Wm. Connolly, San Francisco, Cal.

This invention is for a device for curling hair. It consists of a tube or sleeve, a holder adapted to slip therein, means for locking the two together, an independent handle slidable upon the projecting end to receive the end of the sleeve and locking device. Means are provided for heating the tube before the parts are secured together.

FLUSHING TANK.—No. 668,709. Feb. 26, 1901. I. P. Clarke, Alameda, Cal.

This invention is designed to produce a noiselessly operating flushing tank for closets and the like. It comprises a means for filling the tank and automatically cutting off the water supply, a discharge pipe and controlling valve having a lever connection, a hinge seat, a spring plate extending transversely across its back with free ends and normally bent downward. Arms are fixed to and project rearwardly from the seat and engage the free ends of the spring to open the water supply and close the discharge valve when the seat is occupied, the spring acting to raise the seat, cut off the water and open the discharge valve when the seat is vacated.

WATER WHEEL REGULATING DEVICE.—No. 668,801. Feb. 26, 1901. Newton Lamb, Yreka, Cal.

This invention relates to water wheels and governors, and comprises a plurality of nozzles through which water is directed against peripheral projections upon the wheel to propel the latter, a reverse nozzle through which water may be directed to retard the wheel, means for supplying water to these nozzles and valves and means for operating the valves of the various nozzles so that water is simultaneously cut off from the forward driving nozzle and supplied to the reverse or compensating nozzle to vary or check the speed of the wheel.

#### List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING FEB. 26, 1901.

669,058.—ELECTRIC AMALGAMATOR — L. H. Barricks, S. F.  
668,705.—SHIPPING WRAPPER—H. Baskerville, St. Helena, Cal.  
668,769.—AUTOMOBILE — J. Break, Spokane, Wash.  
668,971.—ELEVATOR—E. Brown, Colfax, Wash.  
668,952.—DESULPHURIZER—G. C. Carson, Castella, Cal.  
668,980.—CONCENTRATOR—C. A. Christensen, Oretown, Or.  
668,709.—FLUSHING TANK—I. P. Clarke, Alameda, Cal.  
668,794.—HAIR CURLER—W. Connolly, S. F.  
669,029.—BUILDING BLOCK—E. A. Faller, S. F.  
668,987.—ELEVATORS — D. B. Fleck, Portland, Or.  
669,008.—LATCH—R. Franken, Los Angeles, Cal.  
668,775.—FLOWER HOLDER—J. Herfert, Tucker, Wash.  
668,854.—FISH TRAP—S. J. Knight, Fairhaven, Wash.  
668,801.—WATER WHEELS—N. Lamb, Yreka, Cal.  
668,994.—VEHICLE TIRE—J. B. & A. A. Mahana, Toledo, Wash.  
668,929.—TREATING EAR DISEASES — M. Polich, Riverside, Cal.  
668,776.—PLUMBER'S TRAP — E. Riley, Spokane, Wash.  
668,804.—TEMPORARY BINDER — C. K. Rosenberg, S. F.  
668,724.—CORD CUTTER—S. H. Wiesedeppe, Olympia, Wash.

#### Latest Market Reports.

SAN FRANCISCO, March 7, 1901.

SILVER.—Per oz., Troy: London, 28½d (standard ounce, 925 fine); New York, bar silver, 61½c (1000 fine); San Francisco, 61½c; Mexican dollars, 50c.

COPPER.—New York: Lake, 1 to 3 casks, \$17; carload lots, \$16.75; electrolytic, 1 to 3 casks, \$16.60; carload lots, \$16.50; Casting, 1 to 3 casks, \$16.50; carload lots, 16.35. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.20; San Francisco \$5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £14 7s 6d per ton= 3.125 cts. per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £17 7s 6d per ton = 3.77½ cts. per lb; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, \$14.75; gray forge, \$14.25; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$20.75; open hearth billets, \$21.75; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.75; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, 31c, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 per flask of 76½ lbs.; Export, \$45.00

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c per lb., small lots.

BISMUTH.—New York, per lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 lb lots.

PLATINUM.—San Francisco, crude, \$17 per oz.; New York, \$18.20 per Troy oz. ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, per lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c per lb.

PHOSPHORUS.—F. o. b. New York 50@60c per lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 32½@33½c per lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$1.90 per 100 lbs. 58%; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; sds, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

## SITUATIONS WANTED.

MINING ENGINEER DESIRES A POSITION AS mine superintendent. Thoroughly competent stamp mill man. References. "M. B. I." this office.

MINING ENGINEER, lately connected with cyanide works, quartz mining and smelting, experienced in surveying, experting, developing and designing, wants place as superintendent, chemist or assistant manager. City references. Terms moderate. Address KON, care this office.

WANTED.—A graduate of the College of Mining of the University of California desires a position in mine. Have had one year's practical experience underground. A practical assayer and chemist. Wishes opportunity to show ability. Good references. Address F. H. F., care this office.

WANTED.—A POSITION AS AN ASSAYER and General Assistant, if desired. Ten years' experience in general mining. Two years managing mines in Mexico. Practical knowledge of language. Address Box 28, care of this paper.

Mining Engineer, technical graduate, with nine years' practical experience, wishes position as manager or superintendent of mining or mill proposition. Thoroughly competent and reliable. Best of references. Understands draughting, buying machinery erecting, operating. Experience with all chemical processes, cyanide expert. Speaks Spanish, familiar with Mexico. Prefer position in the U. S. Address Box 25, this office.

Situation Wanted by Mining Engineer of 20 years' experience in California, Colorado, Mexico and Germany. Has had charge of large properties—gold, silver, lead, copper, sulphur and oil. College graduate; good assayer, surveyor and accountant; speaks Spanish. Has experience in railroad construction and road building. Formerly U. S. deputy mineral surveyor and member of geological field force. Will go anywhere. Address P. M., Mining and Scientific Press.

Position as Superintendent of a gold mine or mill desired by an experienced mining engineer and mill superintendent. To take full charge of a gold mine or mill. Technical graduate. Good assayer, surveyor, etc. Can leave present position on short notice. Salary moderate. Address "B. S.," care of this paper.

Engineers, Firemen, Machinists, Electricians: Send 10 cents for new 40-page pamphlet, containing list of questions asked by examining Board of Engineers. GEO. A. ZILLER, Publisher, St. Louis, Mo.

WOULD LIKE TO HEAR FROM SOME PERSON who has a prospect (gold quartz) which he would dispose of on reasonable terms. Would want mine to pay for itself after developing. Address W. J. C., Mining and Scientific Press Office.

**SMELTER PLANS.**  
Drawings, Specifications, for Ore Reduction Plants.  
F. D. BAKER, Mech. Engr., DENVER.

## WANTED.

WANTED—Competent Bit Setter, also Good Diamond Drill Runner. Apply to The Mountain Copper Co., Ltd., Keswick, Shasta Co., Cal., giving full particulars of experience.

**WANTED.**  
A THOROUGH, UP-TO-DATE ASSAYER—A technical graduate, competent to keep mine books, not over 25 years' of age, good health, not afraid of work, must write a good hand, be accurate at figures, good habits, must furnish A1 references. Pay, \$2.50 per day; board, \$20.00 per month. One of pleasantest situated mines in California. Chance for advancement to assistant manager to the right man. Address Box 27, care this paper.

**MILL MAN WANTED**  
for central Arizona: crushing and concentration of lead and iron sulphide ores. Rolls, trommels, jigs (3 compartment Hartz); jig tails crushed 40 mesh under stamps, then to vanners; slimes from rolls to vanners; trommel and jig sizes from 6 to 14 mesh. Must have experience in this kind of mill—with both styles of crushing and concentration. Reference required as to experience, ability and sobriety. Wages \$1 per day. Address Box 28, Mining and Scientific Press office, San Francisco, Cal.

# UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

Patented Dec. 5, 1899; May 29, 1900.

## THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

## "THE DANIEL BEST"

50 Horse Power

## TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

100 POUNDS OF ORE SAMPLED IN 10 MINUTES.

Calkins' Umpire Ore Sampler.

An accurate, quick and absolutely impartial machine for sampling ore in quantities of from one to one hundred pounds. Easily operated and cleaned. No danger of salting subsequent samples. Makes the operation of sampling an easy one; and all competent assayers know that to obtain an assay sample by hand requires more trouble and time than is necessary to reduce the resultant sample to the pulp. Diagonally opposite portions are taken each time; and assay samples are obtained with this machine in less time and with less trouble than by any other method.

The only table made that will take the place of jigs and do away with costly and complicated machinery.

Especially designed for separating zinc from lead.

Solid Iron Tops, planed to a true surface.

All parts are interchangeable.

Wearing parts reduced to a minimum.

Capacity from 15 to 45 tons in 24 hours, according to class of ore.

Our illustrated catalogue contains all the latest information on the concentration of ores. Mailed on application.

THE COLORADO IRON WORKS CO.,

Established 1860.

DENVER, COLO., U. S. A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Long Lasting Roofing.

P. & B. Ready Roofing outlasts all other roofings, and often lasts as long as the building it covers. It's the only roofing made without the faults of other roofings. Better than iron, because it doesn't expand or contract with heat or cold and it doesn't draw heat and increase the temperature of the building; better than tin, because it doesn't sweat and rust out; better than slate, because it doesn't become brittle and flake off; better than shingles, because it doesn't warp, curl or crack; better than all others, because it's made better, of better materials with better facilities. Comes in rolls, easily and cheaply transported; can be laid by anyone without special knowledge or skill. Send for booklet. Address Dept. A.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/2" wide by 1 1/2" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : **S. K. SNODGRASS, Denver, Colo.** (The Windsor.)

GATES IRON WORKS

The Copper Furnace herewith reproduced is one of two sold to the GRANBY CONSOLIDATED MINING AND SMELTING CO., LTD., BRITISH COLUMBIA. The size is 44x160 inches. These two furnaces were sold on a guaranteed capacity of 500 tons per day. Before the furnaces had been in operation a month they developed an average capacity of 600 tons per day, and the highest daily record has exceeded 735 tons. The cost of operation has steadily declined under the management of General Manager Hodges, until six-dollar copper ore is paying a handsome profit.

FULL DETAILS OF OUR SMELTING FURNACES GIVEN IN OUR NO. 11 BOOKLET.

All of GATES IRON WORKS machinery is as good as it is represented to be, and often much better. We build every modern type of apparatus for the reduction of the precious ores by every established process. Our three great lines are these:

**Mining Machinery,
Rock and Ore Crushing
and
Cement Machinery.**

No. 045 Button Balance.
 Sensibility 1-50 Milligramme.

This balance was designed with a
 view to furnishing an accurate and
 reliable balance for silver button and
 moderately accurate gold button
 work.

It has all the latest improvements
 and is an up-to-date balance in every
 particular.

If you anticipate buying and want
 a good balance at a moderate price,
 write us for particulars; you will be
 surprised to find how cheaply this
 balance can be purchased.

For complete description of this and
 other balances write for catalogue A to

CYANIDE 98%
Manufactured by the Roessler & Hasslacher Chemical Co.,
New York, for sale in quantities to suit by

HAAS, BARUCH & CO.,
100 CALIFORNIA ST., SAN FRANCISCO, CAL.
SOLE AGENTS.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes: our experts, however, are constantly devising improvements, the latest being a method of over-coming the difficulties which have hitherto prevented the successful treatment of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,

Mica,	Clays,	Black Sands,
Tin,	Garnet,	Any Sands,
Slags,	Graphite,	Mixed Ores,
Silver,	Fluor Spar,	Metallic Ores.

SAMPLE LOTS TREATED FREE.

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cid, N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

ASSESSMENT NOTICES.

ALLIANCE EXPLORATION & MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of February, 1901, an assessment (No. 3) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of April, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary,
Office—236 Sutter street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of February, 1901, an assessment (No. 2) of ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 4th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary,
Office—320 Sansome street, room 24, San Francisco, California.

SPANISH CONS. QUARTZ MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of February, 1901, an assessment (No. 4) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of April, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

And in accordance with law, and an order from the Board of Directors, made on the 26th day of November, 1900, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of said corporation, in Rooms 322-323 Parrott building, San Francisco, California, on MONDAY, the 28th day of January, 1901, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. C. ANTHONY, Secretary,
Office—Rooms 322-323, Parrott building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors, the day of sale of the above delinquent stock has been postponed to MONDAY, the 11th day of February, 1901, at the hour of 1 o'clock P. M., at the office of said corporation in Rooms 322-323 Parrott building, San Francisco, California.

J. C. ANTHONY, Secretary.

POSTPONEMENT.

By order of the Board of Directors, the day of sale of the above delinquent stock has been postponed to MONDAY, the 25th day of February, 1901, at the hour of 1 o'clock P. M., at the office of said corporation in Rooms 322-323 Parrott building, San Francisco, California.

J. C. ANTHONY, Secretary.

POSTPONEMENT.

By order of the Board of Directors, the day of sale of the above delinquent stock has been postponed to MONDAY, the 11th day of March, 1901, at the hour of 1 o'clock P. M., at the office of said corporation in Rooms 322-323 Parrott building, San Francisco, California.

J. C. ANTHONY, Secretary.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the SPANISH CONS. QUARTZ MINING COMPANY will be held at the office of the Company, 113 1/4 Crocker Building, San Francisco, California, on WEDNESDAY, the 13th day of March, 1901, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on SATURDAY, March 2, 1901, at 12 o'clock noon.

B. N. SHOECRAFT, Secretary,
Office—113 1/4 Crocker Building, San Francisco, California.

DEWEY, STRONG & Co.,

PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

HERCULES stands for the best,
for the most improved — Gasoline Engine.
Special attention given to hoists and mill engines
for mines. 2½ to 400 H. P. New catalogue
Jan. 1st.

HERCULES GAS ENGINE WORKS,

141-143 First St., San Francisco, Cal.

POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.
Send us your inquiries.

The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot, (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tannage) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Copper Queen Mine, Arizona.

Thirty miles south of Tombstone, 56 miles south-easterly from Benson, is Bisbee, Ariz., within 7 miles of the Mexican border; this Cochise county copper property, with its shafts, smelting and reduction works, is the leading property of that section, the converters turning out a copper bullion ore 99% pure copper. For several years nearly 1000 men have found employment from the Copper Queen Co., and at times copper has been produced at the rate of 2,000,000 pounds per month.

Congress, Arizona, Mine and Mill.

About midway between Prescott and Phoenix, Arizona, on the south side of the Date mountains, overlooking the valley of the Hassayampa, is the famous Congress property, 4 miles from the main line of the Santa Fe, Prescott & Phoenix Railway, the latter distance covered by a railroad from Congress Junction. Much has been written about the mine, and full details of all its workings have appeared herein. The ore is remarkable in the vein, showing no break to the 1700-foot level. It carries no free gold, but mills about \$20 in gold per ton. A new 40-stamp mill, 1000 pounds each, drop 100 to the minute, will soon be in operation. The anvil blocks

Copper Queen Property, Bisbee, Arizona.

Smelter of the Verde Queen Copper Co., Jerome, Arizona. (See Page 136.)

under battery weigh seven tons each set in concrete, latter upon stone blocks. There are no amalgamating plates, the process being concentration and cyaniding.

Prospectors' Smelting Furnace.

"Prospectors' smelting furnaces" are sometimes advertised, with results to investors therein sometimes more interesting than satisfactory. Our editorial

Arizona correspondent, while recently visiting Jerome, found a primitive affair of that nature made and used by Harold Boedtker, assayer and chemist with the Verde Queen Copper Co., which, while not a very stylish contrivance, answers all practical purposes, and is a convenient little device. He had a photograph taken of it in "full operation," from which the engraving on this page was made.

THE advance in size and extent of electrical enterprises that have characterized California electrical transmission schemes since 1896 merely serve as an index to even more ambitious enterprises of similar nature. The Bay Counties Power Co. is now putting into practical shape a plan to transmit 50,000 volts 140 miles, and supply light and power to the half-million residents on the bay of San Francisco.

ON pages 141-142 appears graphic portrayal of two giant locomotives—the largest on the continent—and employed, as most large machines are, in mining enterprises. The two pictured on pages 141-142 are fairly representative of the great East and the greater West—the latter always wanting something a little better, larger, more powerful and valuable than anything in any line previously produced, such demand being constantly commensurate with existing requirements.

THE mineral wealth of the territory of Arizona continues to attract deserved attention, and its development is inducing skilled labor and capital. The territory shares in the general prosperity and is making a showing that entitles it to consideration as a State. Increased freight facilities, improved mining methods and decreased cost of supplies are helping there as elsewhere. Twenty years ago it cost more to pay the freight charges on the goods brought into the mines than the supplies now cost delivered at Arizona mines.

PROF. N. S. SHALER prophesies that within thirty years the world will be suffering from a glut of gold. When such an experienced man as he says anything, it is worth listening to; but, in this case, the element of probability is lacking in the assertion. While it is manifest that modern methods make easier the production of gold, yet it is equally manifest that in the very nature of things it is impossible that gold or silver can be profitably produced except by the investment of considerable money and skill. The mistake of Mr. Shaler is in assuming that the mining of gold and silver is in every way analogous to mining coal or iron. In the case of the precious metals there have always been and will always be natural restrictions and difficulties of production that will make impossible the "glut" that has been so repeatedly predicted. Financially, the fact is to be noted that the increase in the world's production of gold keeps exact pace with the demand for money.

Leaching Copper Ores by Sulphurous Acid.

The above is the title of a paper read by E. P. Jennings of Salt Lake City, Utah, at last week's session of the Canadian Mining Institute. The widespread inquiry regarding this general subject of leaching of copper ores justifies notice of the process which has been patented in the United States by J. W. Neill, of Salt Lake City, Utah. It is stated to be more especially designed for treatment of deposits of copper ore remote from transportation, fuel and fluxes.

Native oxides and carbonates of copper are soluble in sulphurous acid with the formation of cuprous sulphite, a salt insoluble in ordinary water, but soluble in water containing sulphurous acid from which the copper can be precipitated by driving off the excess of sulphurous acid by heat, the precipitate being cuprous sulphite, containing 49.1% copper, and is a heavy, crystalline compound of a dark red color, which settles readily from the solution and can be washed by decantation, dried and reduced to metallic copper by fusing on the hearth of a reverberatory furnace. The process is stated to be for sulphides or oxidized ores, the former being first roasted to expel the sulphur and convert the copper compounds into oxides, as sulphurous acid does not attack sulphides. The ideal ore is one carrying oxides or carbonates of copper in a siliceous gangue; lime and magnesia are objectionable, as they dissolve in sulphurous acid and, while they do not materially interfere with the reactions, they consume a certain amount of sulphur and so increase the cost of the process.

In practice the ore is crushed to pass a 20-mesh screen, placed in covered tanks filled with water containing sulphurous acid and kept in a state of agitation by forcing a current of sulphurous acid from the gas generators through the solution to bring each particle of the ore in contact with the acid and to keep the water saturated with sulphurous acid gas. The statement is made that all the copper will pass into solution in from one to four hours, depending on the physical condition of the ore.

The charge is then drawn into a settling tank, the sands allowed to settle for a few moments, when the solution, carrying more or less slimes, is decanted into a filter press to separate the solution from the slimes and force it to the precipitating tank. The sands in the tank and the slimes in the filter press are washed once with sulphurous acid, which is afterwards used in the treatment of the next charge. The dissolving tanks are arranged in series, one above the other; the gas entering the lower one and passing through each one in turn, the excess being finally absorbed in a condensing tower.

The precipitating tank is supplied with a steam coil through which the exhaust steam from the crushing plant is passed, heating the solution and precipitating the copper as cupro-cuprous sulphite which settles rapidly to the bottom of the tank. The solution from this tank is run into another tank while still hot and freed from small amounts of copper that is in solution as sulphate by means of a little lime. The precipitates are dried and smelted to fine copper. It is further stated that the plant can be so arranged that nearly all the sulphurous acid except that combined with the copper can be saved and used again; that one pound of sulphur is required to convert four pounds of copper into sulphite, and another pound of sulphur will keep the cuprous sulphite in solution, but that the greater part of this second pound of sulphur can be recovered. In practice about one pound of sulphur is required to treat three pounds of copper contained in the ore. The sulphurous acid is to be obtained either by burning pyrites or sulphur. When the original ore is a sulphide, it should furnish, by roasting, sufficient sulphurous acid for its own treatment.

Mr. Jennings states that in experiments made by him on ores in northern Arizona, 95% of the copper was extracted by leaching the ore for four hours; the ore was a mixture of blue and green carbonates with some oxide disseminated in sandstone the grains of which were firmly cemented by a secondary deposition of silica, making the rock harder to crush and more difficult to leach than an open-grained sandstone would have been, as the little particles of cop-

per were coated with silica. The further statement was made that a plant will be erected for the treatment of copper ores of the Coconino plateau in northern Arizona.

THE extensive information as to the profitable nature of dredging for gold given by this paper has created a new era in that branch of gold mining, for its economic advantages are manifest. Large areas of placer ground, hitherto unworked, are shown to be susceptible of profit by this method, and in several States companies intelligently managed are making money. Given the right ground and the right machinery, with competent management, a moderate share of success may be assured. In this regard it is to be noted the absolute necessity of thorough testing, prospecting, preliminary proof of the value of the ground that it is intended to work. As in all other cases, preliminary work of that kind is a matter of true economy. A case in point is afforded by last week's fiasco of the South Fork Hydraulic Mining Co., which proposed to operate this season on the South Fork of the Salmon river, 20 miles east of Warren, Idaho. With apparently the best of business intentions, the company organized, put up \$20,000, which was spent in "getting ready," when the discovery was made that there was no gold in the claim. It is, of course, manifest that the company would have shown better business judgment in spending \$5000, if necessary, in thorough prospecting of the tract it proposed to work, than in spending \$20,000 in work that should have followed, not preceded, the necessary work of thorough prospecting. Nothing is to be taken for granted. It is foolish to spend any money on any proposition for dredging a tract of placer ground until prospecting shows that the gold is there, for every dollar so spent may save \$10 later on. The company noted has sunk \$20,000, with nothing to show for it but a little experience. The most hasty perusal of any one of the hundred expert technical articles on that very subject that have appeared in this paper would have saved the company their \$20,000; but it is possible the projector of the scheme was one of those men who "don't propose to be told nothing by no paper."

It seems to be the regular thing for mining men and mining institutions to growl at chambers of mines and mining bureaus. The Canadian miners are now calling the Central Canada Chamber of Mines some hard names, and claim that "it is run by a clique." Such things sometimes go that way. In the case referred to the blame seems to be deserved, though sweeping censure is not always in order. The acts of a mining bureau or chamber of mines are usually commensurate with the ability of its executive head, the amount of public money at its command, and the degree of public attention accorded to the institution. It is noted that the California Legislature has grown generous, and has raised the annual appropriation of \$25,000 for the maintenance of the State Mining Bureau to \$30,000, which is just one-tenth of 1% of the annual mineral yield of the commonwealth. It is further noted that the entire appropriation for the California State Mining Bureau for two years, made by the Legislature that adjourns to-day, aggregates \$67,000. Of this, \$29,000 is for field work, \$28,000 for the maintenance of the Bureau in San Francisco, \$7000 for printing reports, \$3000 for reprinting reports. The appropriation clause repeats the requirement of two years ago, viz., that the field work shall be done by men appointed by the Governor, who shall also fix their compensation, thus making the State Mineralogist merely a figure-head, to sit in his office and do nothing except to draw a salary.

FRAUDULENT oil prospectuses and advertisements previously referred to are greatly in evidence, greatly to the detriment of the legitimate development of that great branch of the mining industry. Some of these advertisements are models of persuasion, so mixing fact and falsity as to deceive any one not posted. And the truth itself is worked in such a way as to imply a different meaning. In a glittering prospectus issued in Minneapolis, Minn., of a Kern Co., Cal., "oil property," urging the purchase of stock therein, is the statement: "It will be utterly impossible to predict what the price of this stock will be six months hence." It certainly will.

Concentrates.

SUNDAY work on the Comstock, Nevada, ceased Feb. 23, 1896.

IN California no lien exists as to laborers employed by the day.

THE California mineral land bill was not passed at the late session of Congress.

SYLVANITE is a telluride of gold, carrying tellurium, 55.8%; gold, 28.5%; silver, 15.7%.

THE cost of copper production at Anaconda, Montana, is understood to approximate 6½ cents per pound.

THE U. S. refiner who imports lead bullion to separate precious metals in bond is required to export 90% of the lead therein.

THE temperature of the water in a boiler, when the latter is in operation and carrying 180 pounds pressure by the gauge, is 379.4° F.

COPPER 80 pounds, tin 12 pounds, lead 8 pounds, silicon copper 2½ pounds, will make a superior bearing metal for railroad car brasses and other heavy stock.

IN application for patent, where the plat of the survey does not correspond with the field notes, it should be corrected so as to exhibit the subdivisions called for by the field notes.

EIGHTEEN CUBIC FEET of gravel in bank or 27 cubic feet dry, weigh a ton. Thirteen cubic feet average gold or silver ore in mine, or 20 cubic feet broken quartz, weigh a ton.

IN raising the temperature of pure water from 32° to 212° F., its volume increases .0466: 500 cubic feet water at 32° when raised to a temperature of 212° will have a volume of 523.3 cubic feet.

THE railroad freight on oil from Bakersfield, Cal., to San Francisco has been 46 cents per barrel; the tank steamer line from Ventura, Cal., freight to San Francisco is 15 to 20 cents per barrel.

THE California Mining Bureau makes free analyses of minerals from any part of the State, but qualitative only, never reporting on the percentage, as the commonwealth does not come in competition with professional assayers.

STEEL RAILS for railways are sold by the long ton. For European railways Pittsburgh, Pa., now furnishes them at seaboard, f. o. b., at 1 cent per pound, \$22.40 per ton. For American railway use the price is \$20 per ton, f. o. b.

ACCORDING to sworn statements of officials, in the six months from July 1, 1900, to Jan. 1, 1901, the American Smelting & Refining Co. earned \$2,950,000. During the same six months it is officially stated that the Guggenheims earned \$2,250,000.

A MINING MACHINERY FIRM is entitled to a mechanics' lien for material furnished, it being expressly agreed in the contract that the supplies were to be furnished for the particular mine, mill or structure upon which the lien is claimed.

IN the case of a duplex direct-acting, triple-expansion engine, steam when superheated 125° F. will do 16% more work than when saturated. With steam so superheated and the feed-water passed through an exhaust heater, a given amount of fuel will produce 10% more work.

LEADSULPHIDE DEPOSITS in metamorphic—or in eruptive—rocks are generally richer in silver than those in sedimentary strata. As a rule, also, galena associated with pyrites, blende and other sulphides—that is, impure ore—carries more silver than the purer mineral.

THERE is no authority for the amendment of a patented entry for the benefit of a transferer. In the absence of an adverse claim asserted within the period of publication, the Interior Department rules that it is warranted in the assumption that no such claim exists.

KEROSENE poured on the surface of cold water still, will not mix with the water; but if the water be violently agitated, the oil will reach all parts of the containing vessel. Kerosene oil and hot water readily mix, and the agitation of the water in a steam boiler when in operation will carry the oil to all parts of the boiler.

NORTHERN PACIFIC RAILWAY CO.'s tariff No. 4509 quotes from Mullan, Burke and Wallace, Idaho, to Omaha, Neb., \$12 freight per ton on ore or concentrates worth less than \$50 per ton; \$14 between \$50 and \$65 per ton, and \$16 over \$65 per ton, "figuring 100% of the metals at the gross New York prices of refined metals."

THE Gilpin Co., Colo., mill crushes very slowly, and exceedingly fine, the sulphide crystals being broken so small that most of the gold films in the cleavage planes are exposed. Everything is so arranged as to secure the most thorough amalgamation possible with a battery and plates, the idea being to make even the sulphides yield enough of their gold for profit.

COPPER STATISTICS for 1900, so far as procurable, show a total U. S. production for the year of 268,681 tons. The corresponding figures for 1899 and 1898 were 262,206 and 234,272, respectively. U. S. copper imports for 1900 aggregated 89,431 tons. Last year's output of copper in this country was less than 5000 tons in excess of that of the preceding year.

TO CLEAN MERCURY digest with dilute nitric acid for twenty-four hours, taking one part acid to three of water. In retorting fowl quicksilver to purify it the retort should only be half filled, and the quicksilver covered with a layer of quicklime or charcoal powder. The

heating should then be done very gradually, the retort not being brought to a full red heat.

ON the 7th inst. lead was quoted in London at £13 15s per ton of 2240 pounds, equivalent to (exchange \$4.85) \$60 per short ton, or 3 cents per pound. On the same day lead was worth in Chicago 4.25 cents per pound. Freight on lead and insurance, Chicago to London, would figure \$8.50 per ton; this from the \$60 makes \$51.50 per ton which the imported lead was worth in Chicago, so that there would be nothing in such exportation. U. S. tariff on pig lead is 2½ cents per pound.

REGARDING the detection of minute quantities of gold in ore, it has been shown that a white, infusible ash of paper acquires a red or purple coloration if the paper has been soaked in a solution which, when ignited, leaves metallic gold. For the extraction of gold, an efficient solvent is a mixture of ether and bromine, or one of equal volumes of bromine and aqueous hydro-bromic acid. An aqueous solution of iodine in hydriodic acid is also recommended. This method will detect 0.75 gramme of gold in a ton of ore.

THE duty of a reheater is the sum of two distinct actions—the drying of wet steam and superheating of the steam thus dried. For the first, it must be competent to supply the amount of heat per unit weight. The area of heating surface and the temperature-head producing flow into the drying stream, as it passes into and through the reheater, must be sufficient to furnish this amount and also the quantity per unit weight required to insure the demanded superheat for each unit weight of steam flowing through the reheater.

MERCURY mixed with grease or rosin becomes sluggish and large grains of gold will float upon its surface without being amalgamated. Its brightness is changed to a dull leaden color and it flows easily. Distillation will not purify the mercury from the grease or rosin, as these substances pass over in retorting and condense again. By washing the mercury in a strong solution of potash, obtained by leaching wood ashes, the flooring or sickening of the mercury may be overcome. An interesting and valuable article on recovery of greasy mercury, written by an expert, appeared in the issue of Jan. 13, 1900.

WHERE A applies for a patent for a claim located in 1898, and B and C have claims located in 1897 conflicting with A's claim, and they wish to bring adverse suit, either B or C (to make one suit of it and save expense) must convey to the other his interest. Two different owners can not join in an adverse suit. B or C must appear singly as the sole owner of the two claims. The adverse must be filed with an abstract of title in the land office where A's application was made within sixty days from the first appearance of his advertisement of application for patent, and the adverse suit in support of the adverse claim must be begun in a court of jurisdiction within thirty days after the adverse was filed in the land office.

A GOOD PROPORTION for mixing concrete materials for foundation work is as follows: To one barrel of cement—4 cubic feet—add 16 cubic feet of crushed stone, 9 cubic feet of sand, and from fifteen to twenty gallons of water, the whole making about 29 cubic feet. A batch of the above proportions makes, when tamped into place, 18 feet of concrete. The amount of material in a cubic yard—27 cubic feet—of concrete is: Cement, 5.8 cubic feet; sand, 11.6 cubic feet; crushed rock, 22.2 cubic feet. The difference between Rosendale and Portland cement is that in the former it is seldom the case that all the materials are so exactly proportioned that all of them are active, consequently there is a mass of inert material present in natural cement which, while it has no weakening effect, is useless and detracts from the value of the cement. In Portland, which has been called an artificial cement, the different ingredients are so proportioned that all are active and consequently every ounce of cement does its share of the work.

CYANIDE consumption is of individual requirement, ranging from 3½ ounces to five pounds per ton of ore treated. Probably eight ounces per ton might be considered average. The consumption of cyanide in some mills is a considerable item. Some time ago the De Lamar, Nev., mill was credited with the usage of 900 pounds cyanide of potassium per day. At the time it was stated that the peculiar character of the ore there made it require three pounds per ton. The use of lime is a great saving in cyanide, correcting the acidity of the ore, neutralizing it, and aiding in cyaniding. The lime, dry-slacked and powdered, is added as the ore is charged into the tank, from one to two pounds lime per ton of ore. Like everything else in connection with the cyanide process, success depends upon exactness in quantity and method, which can only be secured by careful, intelligent experience in each individual case. It is possible to work \$3 gold ore by the cyanide process at a profit, but it requires expert management.

THERE are two ways to find the size of pump necessary to fill or empty a tank or cistern of given capacity in a given time. First: Divide the number of gallons to be moved per minute by one-third of the piston speed in feet per minute; the square root of the quotient will be the diameter. Second: Divide the number of gallons in the tank or cistern by the number of minutes in which it is to be filled or emptied. Then divide the required capacity of the pump expressed in gallons per minute by the number of strokes per minute for a single pump, and twice the number if a duplex pump. Divide this quotient expressed in cubic inches by three-fourths

the length of stroke in inches, and by .7854; the square root of the last quotient will be the diameter of the water cylinder. For instance: A tank contains 9000 gallons water, and is to be filled in thirty minutes: $9000 \div 30 = 300$, which divided by the number of strokes per minute (assumed to be 100 of 12 inches each) would give three gallons for one stroke, or 693 cubic inches; this divided by three-fourths the length of the stroke in inches, and by .7854=98, and $\sqrt{98}=9.89$, or, approximately, 10 inches diameter.

MICA may be white, amber or black. It is usually mined by making open cuts or pits, as often considerable dead work is required on both sides to secure the crystals intact. Dead work is the most expensive item in the mining, as the rock requires only crude culling, simple hoisting and pumping machinery, although in some places steam or air drills are employed to advantage in place of hand drills. There is often found in association with mica crystals apatite, calcite, fluorspar, hornblende, tourmaline, scapolite and quartz. Each pocket or lens is usually followed at greater depths by a similar pocket. The market value of mica depends upon the size of the plates, the ease with which it cleaves into uniform plates and its flexibility. It should be without holes or cracks, and should contain no trace of magnetic iron ore, as that makes it useless for electrical purposes. The mica is put on the market as "thumb-trimmed," being split into sheets about $\frac{1}{16}$ inch thick and sorted into different sizes or grades. The average price, delivered, varies. Pieces 1x3 inches would sell for about 7 cents per pound; 2x3 inches, 18 cents per pound; 2x4, 32 cents; 3x5, 75 cents; 4x6, \$1.15; 5x8, \$1.40; 8x10, \$1.80.

IN California the right to the use of running water flowing in a river or stream, or down a canyon or ravine, may be acquired by appropriation. This must be for some useful or beneficial purpose, and when the appropriator or his successor in interest ceases to use it for such a purpose, the right ceases. The person entitled to the use may change the place of diversion, if others are not injured by such change, and may extend the ditch, flume, pipe or aqueduct by which the diversion is made to places beyond the first use. The water appropriated may be turned into the channel of another stream and mingled with its waters, and then reclaimed; but in reclaiming it the water already appropriated by another must not be eliminated. A person desiring to appropriate must post a notice in writing, in a conspicuous place at the point of intended diversion, stating therein: First, that he claims the water there flowing to the extent of (giving the number) inches, measured under a 4-inch pressure; second, the purposes for which he claims it, and the places of intended use; third, the means by which he intends to divert it and the size of the flume, ditch, pipe or aqueduct in which he intends to divert it. A copy of the notice, within ten days after it is posted, must be recorded in the Recorder's office of the county in which it is posted. Within sixty days after the notice is posted the claimant must commence the excavation or construction of the works in which he intends to divert the water, and must prosecute the work diligently and uninterruptedly until completion, unless temporarily interrupted by snow or rain. Completion means conducting the water to the place of intended use. By a compliance with the above the claimant's right to the use of water relates back to the time the notice was posted, but a failure deprives the claimant of the right as against a subsequent claimant who complies.

FOR determination of lead in galena, transfer two grams of the finely powdered ore to a 4-inch porcelain evaporating dish; add 25 cc. nitric acid, warm, then 15 cc. sulphuric acid, and evaporate carefully until red-fumes cease to be evolved, and the residue is nearly dry. Allow to cool, add a few drops of dilute sulphuric acid and 75 cc. water, bring to a boil, filter, and wash well. Neglect the filtrate. Wash the precipitate from the filter into a No. 3 beaker, using not over 75 cc. water; add 100 cc. of a solution of sodium carbonate in water (1 to 10) and boil the contents of the beaker for fifteen or twenty minutes. Solution must be strongly alkaline. By this action the lead sulphate, formed by the nitric and sulphuric acids upon the sulphide, is converted into carbonate. Filter, wash well with boiling water until reaction of washings is no longer alkaline. Neglect the filtrate. Wash the precipitate into a No. 3 beaker with about 75 cc. of water, add 75 cc. strong acetic acid, warm, and keep the contents of the beaker at boiling temperature for ten minutes, the beaker being covered with a watch glass. The lead carbonate is thereby decomposed and soluble lead acetate formed, while any silica or gangue remains insoluble. Filter, wash well with hot water until the washings are no longer acid. Neglect the residue on the filter. To the solution of lead in the beaker, which should not exceed 150 cc. or 200 cc., including the washings, dilute sulphuric acid is added in slight excess until no more precipitate is formed. After standing for half an hour the lead sulphate is filtered upon a No. 3 ashless filter, and washed thoroughly with hot water. Dry at 102° C. Transfer the lead sulphate from the filter paper to glazed paper, and ignite the filter paper in a weighed porcelain crucible. After complete incineration, allow to cool, add a few drops of dilute nitric acid, and warm gently. (Any lead reduced from lead sulphate by the burning paper will be dissolved, forming lead nitrate.) Add three or four drops of sulphuric acid and evaporate to dryness; add the rest of the lead sulphate that is upon the glazed paper, and ignite contents of the crucible to redness; cool to desiccator, and weigh; repeat to constant weight.

The Parral, Mexico, Mining District.

TO THE EDITOR:—It seems almost incongruous to speak of Parral as a mining town. Sleepy, inexpressibly dirty, of devious and crooked by-ways, there is but little to identify this Mexican camp with the hustling, bustling mining towns of the United States. Reached by a leisurely little branch of the Mexican Central, which leaves the parent stem at Jimenez, Chihuahua, and meanders with infinite deliberation through fertile corn fields to the west, one is more inclined to believe that he has inadvertently strayed from his original destination into some far eastern land—in fact, one's thoughts are irresistibly carried to the Holy Land by a haunting similarity of aspect, both in country and people.

Appearances to the contrary, however, Parral, or, more correctly speaking, the Parral district, is one of the largest mining centers in the republic. Much foreign capital is invested, both in mining and milling enterprises, and, in addition to late mineral discov-

some of the richest silver mines in the State of Chihuahua, notably the Refugio, owned by Angel Garcia. It is related that Garcia was approached by some promoter in regard to getting an option on the property. The old man drew out his watch, glanced at it, and replied that he would give just twenty-four hours' option. If at the end of that time there was \$1,000,000 gold in the bank to his credit the mine could be bought. Needless to say, it is still in the possession of Senor Garcia.

One of the most distinctive features of the country, the freighter and his mule or burro train, is slowly giving way before the rapid advance of the railroads. Minas Nuevas has for some four months been in communication with Parral by means of the Parral y Durango railroad, which is a private enterprise built and operated by Pittsburg capitalists, whose holdings, including mills and mines, are very large in Minas Nuevas. This same company is running a narrow gauge line into the mountain woodlands, which will greatly facilitate for them the solution of the fuel question.

Santa Barbara is now reached by a spur of the Mexican Central, which is pushing its way to the Durango State line and will tap the rich mining and agricultural district contiguous to Rosario. Naturally, many of the smaller and more inaccessible interior towns will never cease to depend upon mule and burro trains, and the humble, long-enduring little animals will continue to be an important factor in their existence.

Deep mining is the rule of the entire Parral district, and is essentially not a poor man's proposition. Mining here is practically open only to rich companies.

There are, of course, sporadic cases of "grass root" propositions, but they are very rare, and in the generality of cases have been gathered in by some Mexican, whose eye for ore, by the way, is simply phenomenal. And here it might not be inopportune to say that there is much misapprehension in the minds of many Americans coming here from the United States in regard to the ability of the average Mexican to recognize a

good thing when he sees it. He is not only an excellent judge of ore, but is as difficult to deal with as the keenest Boston promoter. One generally finds him in supreme possession of the most desirable properties, either through denouncing or that most objectionable dog-in-the-manger method, the zona, which effectually keeps everyone at a distance while the gentleman makes up his mind whether he really wants that special piece of ground or not.

The mining of the Mexicans is as a rule carried on after the primitive fashion set by their forefathers. The shaft is usually a small, square hole zigzagging

along the vein, where the ore has been followed and gouged out regardless of method or safety. A slender pole with steps roughly notched in, familiarly known as a "chicken ladder," forms the only means of communication between the workings and terra firma. All ores and waste are laboriously carried up in small rawhide bags, called "zurrone," on the backs of peons, sometimes as high as 300 pounds to the load. Their implements are crude and rough, and one can only marvel at the amount of work accomplished with the means given. Here is where foreign capital and enterprise come in. Most of the mining supply companies of the United States have representatives here, and many thousands of dollars have been spent during the last two or three years in machinery for the Parral district.

The American mine operators here are credited with having advanced wages fully 50%, but the result is regarded a trifle dubiously by the more thoughtful. Mexican character is a thing peculiar unto itself. The peon is absolutely without ambition. Given a blanket, enough to eat and smoke and he toiled not, neither does he spin until driven out by actual necessity. As he now makes from \$1.00 to \$1.25 per day where he formerly earned 60 to 70 cents, he consequently works only ten days where he worked twenty under the old regime. From observation I am inclined to believe that the so-called cheap labor of Mexico is cheap in every respect and quite as expensive in the end as higher priced but more competent labor. For example, I was a witness the other day of the erection of an ordinary windlass. The Ameri-

can in charge was actually obliged to start the nails for his workmen, notwithstanding the fact that they had just received most flattering mention as being, all of them, highly efficient in every way around a mine. The peon is willing, but, like the man from Missouri, he has to be shown. Anyone of an economic turn can readily figure what this means where a large force of natives is employed.

The experiment of employing Chinese labor in the mines has been tried in the State of Zacatecas with apparently satisfactory results, and it would not be surprising if this should prove to be the solution of the labor question for the vexed mine manager. Whatever debatable qualities the Mongolian may possess upon his native heath, he is certainly a dependable and industrious quantity abroad.

Impartially summing up the situation, however, one can but be impressed by the immense possibilities presented by the mining industry in Mexico. It is yet in the very longest of swaddling clothes, and under the combined effect of capital, improved methods and well-directed scientific knowledge there is practically no limit to future achievements. One naturally contends with different obstacles in different countries, but as there is no problem without its adequate solution, it can confidently be counted upon that the new century will see Mexico well to the front in the modern mining world.

Parral, Mexico, March 1. AMERICAN MINER.

Colorado Chlorination Plant.

TO THE EDITOR:—The new chlorination plant of the Standard M. & S. Co. at Colorado City was started on the 1st inst. Erection of the plant was begun in May, 1900. The ore first goes through crushers into the sampling department, which has a capacity of fifty tons per hour, thence conveyed to a bedding floor 200x100 feet, capable of storing 12,000 tons of sampled ore. From the bedding floor ore is conveyed to driers, 151x12 feet, capacity 600 tons per day. The ore then goes to the fine crushing department, which contains seven sets 14x30 belted rolls, etc., then to storage bins, from which it is conveyed to four roasting furnaces, each having a capacity of 100 tons per day. It is then cooled automatically and conveyed 400 feet to the chlorination department, containing eleven 10-ton barrels, each having a capacity of from forty to fifty tons per day. From here the solution passes to the precipitating building, containing eighteen tanks with a capacity of 200,000 gallons, eight of these tanks being used for precipitating gold from solution, and ten for settling and storage purposes. This department also contains nine filter presses, which collect the precipitated gold sulphide. This is dried, roasted and refined into gold ingots, and afterwards melted into bricks for shipment to the Denver mint. Tailings from the tanks are discharged automatically into receiving pits and tanks, from which they are distributed to concentrating tables, sixteen being used for preliminary concentration and four as finishers. From these tables the tailings are distributed to other concentrators, and from the latter they are sluiced to the waste dumps. The entire plant is driven by twenty-eight electric motors, ranging from 10 H. P. to 225 H. P. The pumping plant, located 2500 feet away, consists of a 13x18 triplex pump, capacity from 1,500,000 to 2,000,000 gallons per day, driven by a 120 H. P. synchronous motor directly connected to the pump.

Colorado City, Colo., March 9.

Some Business Suggestions.

TO THE EDITOR:—Don't you think it would be business for you to compile a weekly letter telling of contemplated plants and machinery requirements and equipments, and send it to your advertising patrons, that they may have advance information as to who is in the market, or likely to be, for mining material? I have seen such announcement, in the shape of a circular letter, sent to men in the business of supplying mining machinery of all kinds, and would like to see the MINING AND SCIENTIFIC PRESS in the lead in this, as it is in other things. S. C.

Denver, Colo., March 8.

The idea is an excellent one and is being constantly acted upon by this paper in a way that gives the suggested information in a fresher and better form than in the way spoken of. Instead of waiting until such business news is stale and valueless, this paper weekly publishes the freshest and newest announcements in that line, those business pointers being found in every issue under the head of "Mining Summary," which, while furnishing the latest news of general interest as to what is being done, appraises dealers in and manufacturers of mining machinery of what is now or is likely to be in the market for mining appliances and materials of all kinds, being from one to three weeks ahead of contemporary efforts in the same direction. This is one of the established features of the paper and appears in every issue.

Fast Freight System, Parral, Mexico.

eries, many old Spanish workings that enriched the conquistadores 300 years ago are being exploited by modern methods with most satisfactory results.

In the immediate vicinity of Parral there are but three mines, the Jesus Maria, Taja and Prieto. They are situated on a sharp little knoll that rises precipitously from the edge of town, and are all old discoveries of the Spaniards, but were abandoned in later years by the Mexicans for lack of adequate machinery to control the flow of water encountered with depth. With the exception of the Taja, which is the property of Mexicans, but is under a fifteen-year lease to Kan-

Bird's-Eye View of Parral, Mexico.

sas City people, these mines are owned and operated by Americans. The Prieto is controlled by Denver men, and in connection they have erected a large mill, principally for the treatment of their own ores, but also with the object of receiving custom work. It embraces the two processes of concentration and lixivation, and is fully equipped with every modern appliance.

The objective points for the majority of mining men coming to Parral are the old Santa Barbara district, worked by the Spanish decades ago, and the more recent discoveries known as Minas Nuevas, distant from Parral 7 miles. At the former place are situated the properties of the Montezuma Lead Company, as well as the big Tecolote mine, purchased by the Guggenheims six months ago. At Minas Nuevas are located

The Manufacture of Uranium Compounds.

NUMBER 11.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. OHLEY

Determinations of the oxide U_3O_8 in ores from Paradox show the following percentages:

Samples.	Per cent.
I.....	2.09
II.....	3.19
III.....	3.89
IV.....	4.73
V.....	8.68
VI.....	17.06

If we establish, now, the average of the uranium percentages given above by dividing the sum of the items mentioned by the number of samples analyzed, the result will be the figure 6, cited before, as indicating the uranium contents of the ores at the mines on the aggregate.

In case it is intended to manufacture the crude compound mentioned before from pitchblende, or the oxide, or sodium salt, which latter is generally represented by the formula $Na_2U_2O_7 \cdot 6H_2O$, and known in trade as uranium yellow, three methods are available for their production. The first point to be attained consists, of course, in the selection of the cheapest method effecting a perfect solution of the uranium contents in the mineral, and for that purpose a mixture of nitric and hydrochloric acids in the portion of one to three, known as "aqua regia," will be found to be the cheapest and most effective. The lixiviation and separation of the siliceous residues remaining is the next step in order, when the clear solution thus obtained is precipitated with caustic soda, and the insoluble sodium salt, contaminated with ferric oxide, alumina and lime, which settles in the bottom of the vessel, may be purified by washing with water, since this salt as well as potassium uranate is almost insoluble in the former. It is evident, also, from the points given above that the purity of the final crude but commercial product resulting depends largely upon the amount of admixtures contained in the pitchblende originally used, and that a careful sorting and chemical testing must precede the treatment intended, so as to calculate the amount of sodium uranate obtainable beforehand, and thereby the value of the merchandise produced.

A second procedure for the preparation of the crude uranium compound consists in fusing the pitchblende—which, by the way, is not known to carry any vanadium,—in open crucibles with a mixture of sodium carbonate and nitre, thoroughly incorporated with the powdered mineral, when the oxidizing capacity of the latter will induce the formation of sodium uranate, which may be recovered from the cooled and subdivided mass by lixiviation. Since uranates of sodium and potassium are soluble in acids, a method is given thereby for precipitating the oxide of uranium (yellow) by means of ammonia from solutions of the crude compound, which operation would besides contribute to the purification of the final product to some extent.

When manufacturing the pure sodium salt, free of admixtures, on the large scale, another process is, however, resorted to, which is more costly than those given above, but allows of the immediate disposition of the commercial product resultant at current prices. In this case, 100 parts of pitchblende, which should contain as a rule 45% of uranium oxide, are thoroughly mixed with fourteen parts of burnt lime, and the mixture thus produced roasted in a reverberatory furnace, with the result that a calcium uranate is formed. On adding dilute sulphuric acid to this compound, the calcium of the lime combines with the acid under the formation of insoluble calcium sulphate or gypsum, while the uranium sulphate resulting enters in solution. The latter is drawn off, after the gypsum has settled to the bottom of the vat employed, when sodium carbonate is added, which precipitates the uranium and other metals present. Since an excess of the precipitant has, however, the peculiarity of dissolving the uranium salt formed, the values of that metal are brought into solution by adding sufficient quantities of the same, when the clear solution is siphoned off, and carefully—that is, very slightly—neutralized with dilute sulphuric acid. If now, the liquid is heated to boiling, a finely divided hydrated sodium uranate of the formula $Na_2U_2O_7 \cdot 6H_2O$ gradually deposits from the liquid and settles in the bottom of the vat. This salt is subsequently separated from the superant fluid and dried in the air, when it is brought on the market under the name of uranium yellow, which has, like the oxide, the peculiar property of imparting a remarkable fluorescence to glass and change it into the so-called "uranium glass" by the formation of a sodium-uranium silicate. This soda salt, when exposed in contact with porcelain to the heat of a muffle furnace, yields a fine fluorescent orange in the enameling fire, and a beautiful velvety black at higher temperatures, so that it has found extended application as a paint in the decoration of porcelain or china.

Another compound of uranium, also known in trade as "uranium yellow," but differing in composition from the salt just described, results on the addition of ammonium chloride or sulphate to a boiling solution of sodium uranate, obtained according to the

directions given above. The hydrated ammonium uranate resulting in this manner, which is dried and gently heated after its separation from the mother liquid, possesses the same characteristics as the sodium salt, and is even preferred for porcelain painting on account of its readier decomposability and the deep, jet black coloration which it imparts to chinaware when exposed to the heat of the enameling furnace.

The main and most modern uses of uranium compounds consist, however, in their application as alloys to other metals, and of these the carbide is of special interest and importance, since it has a higher fusing point than platinum, and serves, therefore, as a substitute for the latter in the manufacture of pyrometers and similar instruments. Its improving properties as to elongation, tensile strength and toughness, when added to steel, are known to surpass by far the effects produced by nickel and tungsten, so that the carbide seems to be destined to outrank all other competing metals or compounds in the manufacture of high class steel, armor plate or ordnance.

Besides the purely commercial considerations, uraninite or pitchblende is of great scientific interest, since it gives off the rare gas argon, when heated with sulphuric acid, and produces its own photograph, so to speak, when placed on a sensitive plate. As to the latter property, which is known as radio-activity, it stands at the top of the scale among minerals thus endowed, and the photograph which it produces under the conditions indicated, and the subsequent development of the negative thus obtained, is very distinct and bright. Sir William Crookes of London, the inventor of the tubes named after him, has been busy in this line lately, and the results obtained by him in this respect are remarkable, if not curious. Anyone interested in these researches will be favored with a pamphlet containing descriptions of experiments made, and also a table showing the photographs mentioned above, on addressing Sir William Crookes, 7 Kensington Park Gardens, London, W.

Wet Process Copper Extraction in Arizona.

TO THE EDITOR:—The new groups of mines of the Jerome district extend along the eastern slope of the Black Hills range, overlooking the Rio Verde valley, 3 to 7 miles from Jerome.

The Brookshire belongs to the Geo. A. Treadwell M. Co. and is in charge of G. W. Hill. A shaft, now 2000 feet deep, is being sunk deeper. It cuts through the incline ledge of ore at 200 feet.

The Cliff group, near the Brookshire, is being developed by a tunnel, now in 560 feet, in a southwesterly course. It will tap the ledge, which is in a contact between slate and syenite.

The Iron King mine, a little farther southeast, belongs to the Equator M. Co., in which W. A. Clark is interested. The development here is by means of tunnels, winzes, upraises and crosscuts. An upper tunnel taps the main ore ledge 270 feet from the entrance, cutting into the sulphide stratum, which underlies the oxidized ores nearer the surface. The copper and iron sulphides below carry about 10% copper, with some gold and silver, and run only about 10% silica, but high in iron. The plan, as stated by Supt. Giroux, is to fully develop the property and determine as to the grade and extent of the ore. If conditions warrant it, after the property is developed, the United Verde & Pacific Railroad will be extended from Jerome to the Iron King, a distance of 7 or 8 miles.

The Copper Chief adjoins the Iron King on the west, both groups being on the same ore body; they were formerly in one and known as the Equator, but conflicting interests arose as to location, and, after a great amount of litigation, the group was divided, as appears now. The Copper Chief is about 2800 feet above the Verde valley; the ores are oxidized from the surface down, 240 feet, the ledge on this property being about 150 feet wide. The oxidized ores are defined by Supt. Arthur Hendy as a sand carbonate, running about 1½% copper, carrying gold, silver and lead to the value of \$18 to \$20 to the ton, and containing from 50% to 96% silica. The vein stands nearly vertically between a porphyry hanging wall and a diorite foot wall. A shaft sinks 450 feet on the ledge; it is two-compartment, having ladderway, with landing at every 20 feet. From the shaft four levels have been run. The shaft, levels, winzes, etc., aggregate 3000 feet. A small amount of stoping has been done, the production thus far being the result of development work. Below the 240-foot level the sulphide belt is reached here the same as on the Iron King. Mr. Hendy estimates 250,000 tons of the oxidized ores returnable on the Copper Chief. An experimental lixiviation, leaching and precipitating plant is in operation on the ground, which is to be enlarged, as the method employed is suited to extracting the gold, silver and copper from the oxidized ores. The ore is hoisted and passed through crushers, rolls, screens, reducing it to an 8-mesh, thence into a set of ore bins. From the bins it passes to a roaster, in which, by the use of salt, the metals in the ore are chloridized. It passes from the roast chamber over an inclined iron floor into cars, from which it is dumped into ore tanks, each 24 feet diameter and

6 feet deep, holding 100 tons of ore. Solution tanks are set a few feet above the ore tanks, holding a solution of hyposulphite of soda, which is subjected to heat by steam radiators, then decanted into the ore tanks. After the leaching herein, the tailings are sluiced out through discharge gates at the side; but, when a charge in the ore tanks is ready, it is subjected to a wash water, the latter gathering some of the values, to save which the water is conveyed to special tanks, in which the copper, gold and silver is precipitated by scrap iron. After this washing the hyposulphite solution is applied to the ore. The solution now holding the values passes to precipitating tanks below, when the lead is precipitated by carbonate of soda, bicarbonate of soda or lime. The lead precipitate is gathered from the bottom of these tanks after the solution containing the other values has been drawn off into other tanks below. From the latter solution the gold, silver and copper are precipitated by sodium sulphide. The liquid is drawn off the precipitation tanks into settling tanks, thence into montjus tanks, from which it is forced up to the storage tanks again by compressed air. The precipitate is washed out into a wrought iron pressure tank, which connects with the filter presses.

This property belongs to a company of Connecticut people. The mill is set on the side of the hill, having a 26° incline, by which everything is handled by gravity.

Near Jerome is the Verde Consolidated group, which adjoins the News, Black Hills and Venture groups. It includes six claims and covers a north and south ledge, which is being opened by tunnel work.

Jerome, March 4, 1901.

Mineral Production of British Columbia.

From the returns of the mineral production of British Columbia for the year 1900, submitted to the local Legislature by the Provincial Minister of Mines on March 5th, it is gathered that there was during the year an increase in the value of the output of the lode mines of the Province of \$3,310,428 and a decrease in that of placer gold of \$66,176, leaving a net increase in metallic minerals for the year of \$3,244,252. There was also an increase of \$1,013,238 in the value of coal and coke. No returns are yet available of the value of other non-metallic minerals, so these cannot now be taken into account. The foregoing figures, though, exhibit practically last year's net increase, which was \$4,257,490, as shown in detail in the following table:

	1899.	1900.	Increase.	Decrease.
Placer gold..	\$1,344,900	\$1,278,724		\$66,176
Lode gold...	2,857,573	3,461,067	\$603,494	
Silver	1,663,708	2,295,099	631,391	
Copper	1,351,453	1,615,289	263,836	
Lead	878,870	2,690,577	1,811,707	
Coal and coke	4,053,651	5,066,889	1,013,238	
Total ..	\$12,150,155	\$16,407,645	\$4,257,490	

The total mineral production of the Province for all years up to and including the year 1900 is as under:

Gold (placer).....	\$62,584,443
Gold (lode).....	12,820,546
Silver.....	13,635,708
Lead.....	6,543,358
Copper.....	5,437,871
Coal and coke.....	49,426,700
Other minerals (approximate amount)	2,000,000
Total.....	\$152,448,626

The number of tons of metallic ore mined in the Province in 1899 was 287,343 and in 1900 554,796, the increase for last year having been 267,453 tons. The respective increases for 1900 over 1898 were: In quantity of metallic ore mined, 338,852 tons, and in value of metallic minerals, coal and coke, \$5,652,284, the latter being an increase of more than 50%.

British Columbia Development.

TO THE EDITOR:—The first shipment of copper matte ever sent from the Boundary Creek section of the Boundary district was made to-day by the British Columbia Copper Co. of New York. This company owns the Mother Lode copper mines, near Greenwood. It has its own smelter at that town. The furnace was blown in on February 18th and to date about 175 tons of matte have been produced, the grade of which has been gradually improved until now it is up to 50% copper. Between 300 and 400 tons of practically self-fluxing ore are being run through the furnace every twenty-four hours.

The Dominion Copper Co., of Toronto, will put in a new plant at its Brooklyn and Stenwinder mines at Phoenix within three months—an air compressor, steam cylinders 18-inch and 34-inch diameter by 36-inch stroke, air cylinders 18-inch diameter by 36-inch stroke; ten 34-inch drills with double-screw columns, a 54x12 air receiver and a feed water heater, capacity 200 H. P., constituting a 20-drill plant. The following additional plant for the Stenwinder will also go in: A Bullock diamond drill equal to drilling a 1000-foot hole and 1000 feet of rods; a five-drill air compressor; 60 H. P. locomotive boiler, and a 42x8 air receiver.

Greenwood, B. C., March 4.

Mining and Metallurgical Patents.

Patents Issued March 5, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

SUBMARINE MINING MACHINE.—No. 669,276; A. Allen, Spokane, Wash.

Open-ended sluice box, upper cover portion and base portion removably secured together, to rest throughout its length on and to be dragged along subaqueous bottom, scraper adjustably secured to forward end of box to form continuation of base, operating to deliver material of bottom directly into box, fender plates on base at each side of scraper, compressed water jet pipe discharging into box toward rear to induce current therethrough, riffles in base receiving and retaining precious particles separated from material in its passage, means for dragging box backward and forward along bottom, box in its forward movement receiving, separating and discharging material under water.

CAR HAUL.—No. 669,111; A. M. Acklin, Pittsburg, Pa.

Device for moving or controlling movement of cars down incline, chain having rigid and pivoted hooks thereon adapted to engage with car, in combination with car track having ascending and descending portions thereon, chain arranged on lower level at receiving end with relation to car track.

ART OF EXTRACTING ZINC FROM ORES.—No. 669,410; F. Guiterman, Denver, Colo.

Process of extracting zinc from its oxidized ores containing corrosive metallic oxides, which consists in introducing oxidized ore in divided or granular condition into receptacle, heating ore through walls of receptacle to high temperature, but below volatilizing temperature of zinc, maintaining ore in permeable and mobile condition during operation of heating, introducing into intimate contact with ore current of reducing gas, under pressure, throughout heating,

continuing heating and action of reducing gas until corrosive metallic oxides are reduced, withdrawing ore, finally recovering metallic zinc therefrom by distillation.

PRESSURE ACTUATED VALVE FOR ROCK DRILLS.—No. 669,316; R. L. Ambrose, Tarrytown, N. Y., assignor to Rand Drill Co., New York, N. Y.

In rock drill, combination with cylinder having distributing ports leading to and from opposite ends thereof, inlet port and exhaust port contained within cylinder casing but out of communication with interior of cylinder, pressure chambers arranged at opposite ends of distributing valve, each chamber having port leading to exhaust, two independent primary valves for ports arranged in cylinder casing and projecting into interior of cylinder, reciprocating piston having reduced central shouldered portion, primary valves arranged at such point in cylinder as to be always covered by piston during its movements, to be operated by engagement with central shouldered portion thereof.

METHOD OF RECOVERING METALS BY ELECTROLYSIS.—No. 669,440; H. A. Frasch, Hamilton, Canada.

Method of recovering copper and nickel, from matte or ore, by electrolysis, disintegrating or pulverizing metal-bearing matte or ore so as to render it freely permeable by electrolyte capable of combining with metal or metals to be extracted, distributing mass over bottom of vessel in which electrolysis is conducted in connection with electric conductors to constitute an anode, covering anode with granular, permeable, electrically neutral substance, suspending in electrolyte number of cathode plates upon which metal is collected, passing electric current between anode and cathode.

DREDGING BUCKET.—No. 669,446; O. B. Morris, Camden, N. J.

Combination of framework, comprising crossbar and uprights, bucket having stationary, shovel-like jaw rigidly secured to uprights, and movable jaw pivoted to rigid jaw, crossbar or beam adapted to slide upon uprights, link connections between mov-

able jaw and beam, whereby movable jaw is opened and closed by movement of beam, shaft journaled in uprights, sprocket or chain wheel carried by shaft, chain engaging sprocket or chain wheel having one end connected to sliding beam, its other end connected to suitable power mechanism, power connection for sliding beam.

APPARATUS FOR WITHDRAWING MOLTEN METAL FROM FURNACES, ETC., AND CHARGING SAID METAL INTO MOLDS, ETC.—No. 669,466; J. McRae and G. H. Kitto, Dollar Bay, Mich.

Combination of vessel adapted to receive charge of molten metal from furnace and provided with suitable pipe or conduit for passage of metal, independent suction pipe whereby air may be exhausted from vessel, relief valve having adjustable opening for air located above space to be occupied by metal, whereby flow of metal from vessel can be controlled, relief valve being arranged independently of exhaust mechanism in order that extent of vacuum within vessel may be modified while action of exhaust mechanism persists.

Correction of an Omission.

In the valuable technical article on "Petroleum Oil Pipe Lines" in the issue of the 9th inst. there was an omission in one of the tables that interfered with its accuracy. The table is here reproduced in its correct form:

VISCOSITY SECONDS FOR 50 C.C.

RESULTS OBTAINED WITH REDWOOD'S STANDARD VISCOMETER.

Temperature—F.	AMERICAN MINERAL OIL.			RUSSIAN MINERAL OIL.

Verde Queen, Arizona, Smelter.*

The Verde Queen shaft has reached the water level and sulphide ore at 330 feet depth. On the upper levels the ore contained iron oxides, green and blue copper carbonates and copper silicates. It was on this class of ore that the 40-ton smelter has been running. As a result of their operations three carloads of bullion, running 96% copper, have been shipped. An additional furnace of 100 tons daily capacity will be put in soon, after which their smelter will operate as a matte smelter on the sulphide ores. In the operations thus far, the charge usually ran 7% copper and 30% aluminum, the slag running 1% to 1½% copper, 39% silica and 22% aluminum, which certainly was very careful work. This company's grounds extend from the edge of the town of Jerome southeastward toward the Verde valley.

Jerome, March 2.

*See illustration front page.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Weber & McDonald, operating on Slate creek, near Rampart City, recently cleaned up \$750 after an eleven days' run. Gravel running 40 cents to the pan is being taken out. — Reports from Teller City state that on Nov. 18th last a strike was made on Birch creek, near there, by Johnson & Williamson. — It is reported that ground running 17 cents to the pan is opened up on American creek, a tributary of the Agiapuk river, in Kougarek district, about 60 miles from Nome.

ARIZONA.

GILA COUNTY.

A New York company has acquired the Grand Prize group of eight claims in the northern part of Tonto basin, 11 miles north of Payson and 6 miles south of Pine. This is about 100 miles south of Flagstaff and nearly the same distance northwest of Globe. The group has been developed sufficiently to show a good body of oxidized copper ore near the surface and copper sulphides at water level. It is claimed there are about 6000 tons of ore now accessible, which will average 12% copper. Water and timber are abundant. The Grand Prize Copper M. Co., which controls the property, will at once erect an 80-ton smelting plant on the ground. It is claimed the ores carry gold and silver in values that will be important in the result.

Payson, March 2.

GRAHAM COUNTY.

The General Electric Co. of New York is buying eighty-two copper mines and prospects in the neighborhood of Metcalf, and two mines in the district adjoining the Copela property, in central Sonora, Mexico, to secure its own supply of manufacturing copper.

MARICOPA COUNTY.

Willis B. Troy and associates are the purchasers of the Vulture mine, to operate which the Vulture Gold Co. has been incorporated. It is planned to put in an electric power plant on the Hassayampa river, from which power to run the mine and mill machinery will be transmitted to the mine, 16 miles distant. It is also proposed to lay a pipe line from the same stream to convey water to the property for mine and mill purposes. WASCOTT.

Wickenburg, March 8.

At the Cram Mountain copper mines, near Phoenix, tunnel is in 400 feet; thirteen men are employed.

The Phoenix Reduction Co., capital \$250,000, has incorporated at Phoenix.

MOHAVE COUNTY.

The Arizona & Utah Railroad, standard gauge, runs daily trains between Kingman and Chloride, a distance of about 25 miles. The original plan and future prospect is to extend this line northward from Chloride, via the White Hills, across the Colorado river into Lincoln county, Nev., possibly to connect with a Los Angeles-Salt Lake line.

At Chloride mine operators and prospectors are busy. Operations here have been retarded some by lack of fuel supply, with the result that many of the steam plants are being provided with oil burners, with the idea of using crude oil from southern California. Some of the oil producers of that section have established storage tanks here, from which those using fuel oil will be supplied. Each mine and mill using it is having tanks put up, in which to keep a supply on hand. At the Tennessee mine and mill is a redwood tank that will hold 100 gallons of the crude oil. The impurities in it are principally asphaltum and sand. From the tank the fluid is discharged by a set of twin pumps through a pipe into a cylinder separator, 8 inches by 12 feet, within which are coils of pipe, and, by means of the proper heat, the crude material is removed, the oil fluid passing to the burner in the firebox of the boiler. The burners put in here are made to carry out the hot-air system. By this the burner is supplied with one-fifth steam and four-fifths hot air; a small jet of steam producing a vacuum in vacuum chamber, drawing a jet of air through the hot-air line over top of the burner, bringing steam and air together in the combination tube, there forming a vaporous gas, the result being a steady, diverging flame. There are three boilers here, aggregating 200 H. P. It is claimed they will evaporate sixteen pounds of water with one pound of oil and that the three boilers will require twenty barrels of oil per day.

The old Tennessee mill was destroyed by fire last year. The new one, of which W. J. Rickell will be Supt., will be started up next month. It is equipped for con-

centration, being provided with crushers, two sets of rolls, jigs, elevator, revolving screens and concentrating tables; the result will be jig and table products. The mill, if pushed to its full capacity, would handle about 150 tons of ore per twenty-four hours. The Tennessee ores consist of lead sulphides, the chief savings being lead, silver and gold. The mine is developed through two shafts, each 400 feet deep and both on the north and south ledge of ore. The vein, having fairly well defined granite and porphyry walls, is 10 feet wide in most places. One of the ore shoots has been opened for 250 feet longitudinally with the vein and to a height of 100 feet. The work runs 250 feet south of the shaft and 350 feet north of it. Drifts run at each 100-foot level. The two shafts are connected by underground work. A cage is operated in one and a bucket in the other. The high grades are shipped to the El Paso smelter; a sufficient tonnage of mill ore is on hand to keep the mill operating.

Adjoining the above property on the north is the Schuykill group, controlled by F. W. Theis and associates. The group includes several claims, upon which there is considerable of open-cut and other development along the same vein as that of the Tennessee. An old shaft is being re-timbered and preparations are made to sink a new shaft and erect a concentrating mill.

North of the Schuykill, and inclining with it, is the Elkhart group, the property of the Security M. & Dev. Co. of London, T. B. Comstock of Los Angeles, Cal., being manager. After a close-down of several months, operations at the mine were resumed last winter, though the mill has not as yet been started. Oil burners under the boilers and oil tanks on the premises are likewise being provided here. The shortage of coal for steam uses has hindered the work and made the oil provision necessary. The main shaft, which is an incline, following the dip of the formation toward the west, is 475 feet deep; and as soon as power is better arranged for the work of sinking is to be commenced. The vein structure on all the levels, from the surface downward, shows a rather broken and irregular formation; and it is assumed that at greater depth the vein walls may become more regular and the ore body more concentrated. The underground work consists of levels on the vein, both directions from the shaft, from the first, second, third and fourth stations, with winzes, upraises and crosscuts, all aggregating about 4800 feet, besides a considerable amount of stoping from the third level upward. The work discloses an extensive shoot of ore, having a dip to the west, a north and south trend, but pitching northward on the strike. From this shoot a large tonnage of ore has been stoped, and there appears to be a considerable amount still exposed by present development. Work now in progress consists mainly in following stringers and crossveins of ore that possibly lead to important ore shoots in the wide, but more or less broken, mineral zone. The ores of the property comprise brassy iron pyrites in places and lead sulphides in others, the former carrying gold values. The bulk of production thus far, however, has been lead and silver. Dr. Comstock has laid out considerable work, both sinking and drifting, into unexplored ground to the northward. The concentrating mill, which seems in good condition, will doubtless be started later in the season.

South of the Tennessee is the Mollie Gibson, which belongs to Montana men. It is being developed by Laurence Harris, one of the interested parties. A 150-foot shaft is in a body of ore, some of which is said to have run as high as 70% lead, seventy-five ounces silver and \$10 gold.

The properties above described are near the foot of the Cerbat range, following the north-south trend of the latter. Now the Minnesota and Conor, both in one group, are on a parallel zone, but considerably higher on the mountain slope. This is the property that was developed and operated for several years by John Barry, who sold it some time ago to the Philadelphia & Arizona M. Co., of which E. T. Loy is the manager. The group comprises sixteen claims, covering the north-south strike of a well-known mineral lead. There are four shafts, 240, 300, 200 and 100 feet deep respectively. The shafts are all connected on each 50-foot level. Here the vein walls are well defined, ranging in width from 5 to 40 feet. In many places the material between the walls is all pay ore, there being little waste. In other sections the ore is in narrow shoots. Here they have an iron and lead sulphide in the main, but in places accompanied by arsenical pyrites and zinc. The values are in gold, silver and lead. The iron sulphides are richer in gold, often running \$100 to \$200 to the ton. The high-grade lead shoots run as high as 40%. It is estimated that one-twentieth of the ore tonnage will warrant shipment to the smelter direct, the re-

mainder or the great bulk of it being a concentrating ore that will run \$15 to \$20 per ton. A large tonnage of the latter class is blocked out. One feature of the mine is the presence, in considerable quantity, of native silver and argentite. In the construction of the 150-ton concentrating mill, which is to be erected within the next ninety days, it is proposed to put in pans and settlers, as well as jigs and tables, for the purpose of saving the native silver and such other values as are susceptible to amalgamation. Development work, in the form of sinking and drifting, is in progress. The same company owns the Merrimac mine and mill; the latter of ten stamps and three tables is operating on Minnesota ores. It is said the Merrimac mine is to be further developed.

The Lucky Boy is located 2 miles east of the Minnesota, near the crest of the range, at an altitude of 6200 feet. It belongs to T. B. Scott, of Chicago, and is in charge of F. H. Stull. The property is developed through two tunnels, one 88 feet above the other. The upper tunnel crosscuts 50 feet to the vein, thence drifting on the latter 400 feet. The lower tunnel crosscuts 265 feet to the first vein, continuing to a parallel vein, on both of which long drifts have been run. The upper and lower tunnels are connected and much of the vein matter between the two has been stoped out. The pay streak runs from 2 inches to 2½ feet. Near the breast of the lower tunnel a station is cut, making room for a whim, and there a shaft has been sunk 111 feet on the vein, and drifts are being run therefrom. The ore carries free gold near the surface, but it becomes a sulphide at greater depth. There are also rich streaks of native silver. The mine has been worked more or less for twelve years, but within the last year about 500 tons of ore have been sacked and shipped, same having run about \$100 to the ton.

John Barry is developing the Sunlight and Tuckyho groups, on both of which he has fair prospects. WASCOTT.

Chloride, Feb. 27, 1901.

In the Granite Hill district, 70 miles southeast of Kingman, two claims were located some time ago, on which wolframite, or tungsten, has been found. It is known as the Davis & Haley property. The tungsten occurs within the walls of a quartz vein, in some places in narrow streaks in the quartz and in massive form at other points. Samples run 66% in tungstic acid.

Kingman, Feb. 23.

Mining and prospecting in the River range is attracting interest and some capital. This is sometimes called the Union Pass range. It trends north and south and is from 8 to 12 miles east of the Colorado river. The district becoming known as the Gold Road is on the east slope of the River range, 16 to 20 miles southeast of The Needles. It is near the old Beal stage road, which was formerly traveled from Prescott to Hardyville. The camp is now reached by wagon road from either The Needles, Cal., or Kingman, Ariz., men and supplies going in from both points. The Gold Road group, from which the district takes its name, was located by J. Jeres, who was grubstaked by H. Lovin of Kingman. They found free gold ore near the surface which ran from eighteen to forty-eight ounces gold to the ton. After very slight development they sold the group to Burkhart and associates of Los Angeles for \$50,000, of which \$30,000 has already been paid. The purchasers have developed the claims considerably and are said to have found ore running \$30 per ton at 60 feet depth.

Near the Gold Road is the Smith & Koster group, recently bonded to O. F. Kuencer of Kingman, and by him sold to New York parties, the former retaining an interest.

The Treadwell group of ten claims is considerably developed, disclosing a vein 12 to 40 feet wide, carrying ore that runs \$7 to \$14 per ton.

The Leland group, in the same locality, is being developed through two tunnels, by which a rich shoot of ore has been opened. West & Bedell of The Needles are interested in this.

The ores generally, so far as disclosed by work, are free milling quartz, with apparently some streaks of sylvanite. At the Colorado river, west of the Gold Road camp, there is a mesquite flat from 1½ to 4 miles wide, the river banks being rather low. If production prove as now anticipated, a mill will be erected at this point on the river, where water is accessible.

Kingman, March 1.

Most of the work done at the White Hills is by leasers, who produce about ten tons per month of high-grade silver chlorides, which run an average of 700 ounces silver and one to three ounces gold to the ton, which, of course, is shipped direct to the smelters. The leasers also produce 150 to 200 tons mill ore per month, which averages 150 to 250 ounces silver and one to one

and one-half ounces gold to the ton. The mill ore is handled by the White Hills mill, which is equipped with stamps, pans and settlers. The leasers work on the grounds of the White Hills M. & D. Co., who also operate the mill. White Hills, Feb. 27.

PIMA COUNTY.

The bottom of the shaft in the Red Ray, in McGee Camp, in the Sierrita mountains, near Tucson, is 2½ feet wide; ore, 20% lead and some gold and silver; construction of mill will be pushed. A new road is to be built via the Sopori to Tucson.

PINAL COUNTY.

Work is in progress on the Haley-Souffrien lead properties in Mineral Creek district, near Florence.

YAVAPAI COUNTY.

The Senator mill, of twenty stamps, is preparing to start up to make a run of ore from the Senator mine, and it may continue after that for some time on copper ore from another property. The Senator belongs to the Copper Queen consolidation, of which Dr. J. S. Douglas is manager.

Prescott, March 1.

In Lynx Creek district there is not much work in progress except at the Mudhole mine, which belongs to the Penn G. M. Co. On this property is a well defined ledge of ore which dips at an angle of about 45° toward the south, the strike of the vein trending practically east and west. An incline shaft follows the dip of the vein to 500 feet depth, from which extensive drifting has been done at the 200, 300, 400 and 500-foot levels, with a large amount of stoping between the third and fourth. The width of the vein, as shown in the stopes, ranges from 5 to 15 feet, the gangue comprising a talcose and decomposed quartz material, which breaks down easily. The values, besides being found in the loose talcy material, are carried by a solid lead, iron and zinc sulphide, making a good concentrating ore. The hanging wall is porphyry and the foot wall granite. The stopes are timbered up freely with stulls. The concentrating mill is running about forty tons per day, reducing eight or ten tons of ore to one ton of concentrate. Additional machinery will be put in. The product is gold, silver and lead. Mr. Hascall is manager, A. L. Bell assayer and Frank W. Giroux mill superintendent.

Walker, Feb. 28.

The Jerome Power Co., interested in which are J. F. Mullin, H. J. Allen, W. C. Miller, E. J. Parkinson, D. J. Shea and E. H. Meek, all of Jerome, is pushing work on a project to construct 9 miles of canal, flume and pipe line to take water from Oak creek, which heads in the mountains near Flagstaff and empties into the Verde river southeast of Jerome. It is estimated 55 cubic feet of water per second will be taken from Oak creek; and 2 miles down from the intake the water line will be reinforced by about 20 cubic feet per second from a group of springs at that point. The profile of the work shows the line will cross ravines in several places, pass through cuts and tunnels in others. The water will be carried in open ditch most of the way, but through a flume and redwood pipe over part of the distance. Nine miles from the point of diversion the water will be dropped 266 feet through an iron penstock to four water wheels of 500 H. P. each; and at this point an electric power plant, comprising two generators, will be installed, the idea being to transmit electric power to the mines and smelters at Jerome and along the Black Hills range, which are from 12 to 14 miles from the point where the plant is to be put in. A force is at work on the ditch and it is expected that the water line and power plant will be completed this year.

Jerome, March 5.

R. H. Bruner of Big Bug is developing the Badger group, on the Agua Fria, 3 miles east of Huron. It comprises five claims, on which free milling ore is opened by cuts. The ore is in streaks and seams in the quartz.

The Rebel group at McCabe, which apparently is on the same ledge as that of the McCabe mine, has one shaft 400 feet deep, over which is a new steam hoisting plant. Another shaft, 200 feet deep, has a gasoline hoist. Both shafts are in a body of iron and copper sulphide ore, carrying gold values. This belongs to H. B. Clifford and associates. John Watterson is foreman and C. E. M. Beall superintendent.

At the lower end of Big Bug gulch, near the Henrietta, is the Cyprus, which belongs to Mayer, Thornton & Kingsley. They have a shaft 420 feet deep, on the vein, which trends east and west, ranging 3 to 4 feet wide. Drifting to the extent of 150 feet, and stoping, opens a body of copper sulphide ore, two cars of which were recently shipped that ran 23% copper and

\$15 gold. They have five cars of first grade ore ready to ship.

T. W. Boggs of Big Bug is developing the Butternut group, whereon he has a 200-foot shaft, with some drifting. He states that 1000 tons of ore have been shipped which ran about 15% copper, \$5 to \$7 gold and a few ounces silver, all of which is carried in a black sulphide of copper.

The old Commercial smelter, between Big Bug and Mayer, belonging to the Commercial Mining & Smelting Co., is now idle, though it is said to be in good condition.

Up the Big Bug gulch, near the town of Providence, are the Sterling, Oriental, Providence, Red Rock and Belcher—the first two being located on the south side of the gulch and the others on the north side.

The Sterling group belongs to Youngstown, Ohio, people, and is temporarily closed down, except the working of a few men under the direction of James Breslin. The main shaft here is 425 feet deep, from which drifts on the first, second and fourth levels have been run 500, 225 and 150 feet, respectively, all going southward from the shaft. The drifts are all connected by winzes and upraises. A 400-foot tunnel has also been driven southward on the lead, at the terminus of which the ledge was cut off. A shaft is being sunk south of this break, in an endeavor to find the ore, having reached 125 feet depth. A shipment of 300 tons of ore was recently made to the smelter. The ore is copper and iron sulphide.

West of the Sterling is the Oriental group. The shaft and workings produce a large surfeit of water and the ores all the way down are considerably oxidized, carrying copper carbonates and free gold, with heavy streaks of black copper sulphides. The last named material has been the main cause of difficulty in concentration. The mill, which is not operating at present, ran 1600 tons of ore in 1900. Kent Bros., under whose management most of the development has been done, think the ores will have to be smelted direct, to avoid the loss in slimes in concentration.

The Red Rock—E. A. Powers superintendent and D. S. Bruner foreman—has a 300-foot shaft on a north and south vein, between syenite walls, ranging from 1 to 6 feet wide, carrying gold and copper ore in a sulphide form. There is approximately 3000 feet of drifting.

The Belcher joins the Red Rock on the north and extends in a group up toward the summit between McCabe and Big Bug gulches. This group covers an ore belt about 300 feet wide, trending north and south, within which are several parallel veins, this belt being bounded by syenite granite walls.

The Poland-Hamilton group, 4 miles west of Providence, belongs to the same people who own the Congress mine. The work here is in charge of J. Gray. The newer workings—on the south side—comprise three tunnels on the strike of the vein and a crosscut tunnel toward the main vein. The lowest is now in 445 feet on the vein; a second tunnel, 145 feet above the latter, is in 2700 feet, which connects with the Hamilton tunnel by a 100-foot upraise, the last-named being 338 feet long. The second, or Poland No. 2, connects with the Bell tunnel, 200 feet above it. The crosscut being driven below all the others, and now in 750 feet, is designed to cut through the mountain to the Lynx creek side, a distance of 6000 feet, and to serve as an avenue through which to carry all the ores to a prospective mill on the Big Bug side. This tunnel will give a depth of 800 feet. The vein here is 3 to 4 feet wide, has a slate hanging wall and a syenite foot wall. The ores are a lead, iron, copper and zinc sulphide, carrying values about as follows: Gold \$14, silver sixteen ounces, lead 7%. It is a good concentrating ore. It is considered quite certain that the S. F. P. & P. R. R. will extend a branch from near Huron, up Big Bug gulch, via Providence, to the Poland-Hamilton group this season.

The summit between Big Bug gulch and Lynx creek at the Poland group is 6995 feet altitude, as shown by a stake of the U. S. Geological Survey.

Providence, Feb. 27. WASCOTT.

The Groom Creek district is 7 to 9 miles from Prescott and the center of a considerable amount of development and some production. The property best developed and equipped is that of the Empire G. M. & M. Co., of which Dr. W. A. Hendryx of Los Angeles is manager and S. S. Jones Supt. It comprises five claims in two contiguous groups, the one developed by a 700-foot tunnel on one vein and the other through a 340-shaft on another vein. On the tunnel drift there is claimed to be 10,000 tons of ore blocked out that may be milled. From the shaft about 500 feet of drifting has been done on each of the two main levels, with considerable stoping, showing a vein width of 2½ to 3 feet. There are well defined porphyry walls.

The vein material is decomposed quartz, porphyry and talc, much of the ore being oxidized, which mills free gold. There are, however, frequent streaks and bunches of lead and iron sulphides. They estimate 30,000 tons of ore in sight between the surface and third level, and that about 3500 tons have been taken from the stopes. A 10-stamp mill on the ground is operating, fuel oil being used under the boilers, by which 45 H. P. is developed by twelve barrels of oil. In the mill a saving of 70% of the values is made by amalgamation, and 80% of the balance is saved by an application of cyanide. No concentrators are used. Capacity is forty tons per day, in which less than 1 miners' inch of water is used. It is so arranged that the water is used over and over again. The tailings from the battery are handled at a cost of 70 cents per ton; the final tailings, after treatment, are said to average less than 40 cents per ton. The mine values average about \$11 per ton.

Sinking progresses in the main shaft. There appears to be four parallel veins on the property, from 250 to 300 feet apart.

The Home Run group, of which D. Moynahan is manager, has a new plant of hoisting machinery, with a shaft sunk 210 feet on a vein of ore, in which 150 feet of drifting has been done. The ore carries free gold, with some sulphides that carry gold and lead. The formation here dips toward the north and west; while the shaft is sunk on what seems to be the main vein, running N.E. and S.W., there appears to be some cross veins. If the showing continues the same as now, as development goes forward, a mill will be erected.

The Monte Cristo, under the management of Harrington Blauvelt, has a good hoisting plant and is sinking in a shaft 140 feet deep. There is 150 feet of drifting on the 100-foot level. The vein, which runs north and south, is about 2 feet in width and carries lead and iron sulphide, having gold, silver and lead values. There is found in this ore a considerable amount of wire silver attaching to the quartz and lead sulphides.

What is locally known as the Slack group is also being developed; it is partially equipped, having a small mill erected.

The Silver King, which has been idle for some time, may be started up soon by Mackin Bros., who have control of the property.

Groom Creek, Feb. 28.

The Richinbar mine, 16 miles southeast of Mayer station, on the Agua Fria river, was located some years ago by Geo. Zika, who still retains an interest in the property. The group was partially developed by the Hearst estate from 1896 to 1899, the equipment including a small mill and pipe line along the river for the development of water power to run a dynamo. Two years ago the property was acquired by Boston parties, since which time the operating concern has been known as the Zika Development, with G. W. Middleton, formerly of Colorado, as manager.

The holdings comprise a strip of ground 1800 feet wide, which extends about 6000 feet along the strike of a vein of quartz, standing almost vertically between syenite walls. The Agua Fria canyon, at this point 800 feet deep, cuts through the formation, showing the quartz vein exposed on both canyon walls. The holdings cover portions of the lead on both sides of the river. The surface of the country on both sides of the river here is a rocky, lava-covered, level plateau.

Under the present management the shaft has been sunk 250 feet deeper, to a total depth of 550 feet, and it is now planned to sink to 750 feet depth, which will reach a level below the river bed. Drifts on the vein have been run at each 100-foot station from the surface down. Recent work has opened the ore body on the fourth and fifth. The vein ranges in width from 6 feet to 40 feet, which carries shoots of ore in a schist gangue. The ore appears a quite free-milling gold quartz, though there are small streaks of iron sulphides. The values run as high as two ounces gold.

Manager Middleton states that there are about 5000 tons of ore on the dump, which has been produced incidentally to the development work; that thus far no stoping has been done. The matter of erecting a 100-ton mill, with crushers, rolls and concentrators, is being considered. At present a force of about thirty men is employed and about twenty-five tons of ore are being hoisted daily. The water in the Agua Fria is of considerable volume at all seasons of the year.

Richinbar, Feb. 27. WASCOTT.

The Sundance mine and mill, now owned by the Reliance G. M. Co. of Chicago, is under the management of L. A. Davies at present. The property is temporarily closed down, pending some readjustment of company affairs. The group embraces ten claims, on which is about 3500 feet of underground work. The main

shaft sinks 356 feet at the junction of two veins—one of which carries lead sulphide and the other iron sulphide. The values, in the main, are gold, silver and lead. The mill ran from August, 1900, to February, 1901. It is equipped with crushers, rolls, trommels, jigs and vanners, and, when operating, ran about thirty-five tons of ore per day, making a jig and table product of about ten tons per day. It is the intention to erect a wire-rope tramway, to convey ore from mine to mill, 1600 feet distant.

The mine is equipped with steam plant, for hoisting and mill work, and which also runs an air compressor for drill work.

WASCOTT.

Prescott, Feb. 25.

YUMA COUNTY.

The first shipment of ore from Quartzite via the Colorado river was made on the 20th ult., eighty tons copper ore, from property of Jackson & Bondurant, near Quartzite. The Beehive and Newhouse companies are sacking ore for shipment. The Orient group, near Quartzite, is sold to Chicago parties, who have organized the Golden Desert M. & M. Co., credited with intention to erect a 100-ton mill for treatment of its ore which is said to run \$100 per ton.

CALIFORNIA.

AMADOR COUNTY.

Sinking is in progress on the Peerless, at Sutter Creek; when the 800-foot level is reached, crosscutting and drifting will begin. The Argonaut, Sutter Creek, is being unwatered. One hundred skips of water are being hoisted every twenty-four hours at the Kirkwood. Work is in progress, now being down 300 feet; crosscutting will begin soon. The Eureka is now crushing fifty tons of ore daily. The shaft at the South Eureka, at Jackson, Supt. Parks, is down 2000 feet. A station will be cut and a drift run on that level. The westward drift from the east shaft of the Kennedy, Jackson, is in 325 feet. Ore from the Price, near Plymouth, recently milled at the Bay State mill, shows \$3 in free gold. Work on the Duff Reeves claim, at south Plymouth, may soon be started by Eastern parties, who are now negotiating for a working option on the property. Operations on the Bay State, 3½ miles north of Plymouth, will begin next month; W. W. Worthing, Pres. Bay State M. Co., is interesting Boston men in the property. A new cable and sheave wheel are in place at the Onida; sixty stamps are dropping steadily. A 25-foot ledge of ore is reported opened up on the 400-foot level of the Fremont, near Drytown; Supt. Purington.

BUTTE COUNTY.

The new mill recently put up on McCabe creek, near Hurleton, is running steadily. An air compressor is going in at the Golden Trout. Twenty-five more men were put on recently.

CALAVERAS COUNTY.

At West Point the Farington G. M. Co. is pushing work on the Lone Star. Operations on the Alpine, better known as the Batista, in Wet gulch, will resume. The tunnel in the Salvator (quartz), on the south side of Esperanza creek, in Mill Valley district, 4 miles from Jesus Maria, now in 150 feet, will be run an additional 20 feet to cut the main shoot of ore; H. C. Newman of San Francisco and E. H. Davison of Oakland owners. Mauna Bros. and Gardella Bros. are pushing work on the Greenwood and Black Oak properties in Wet Gulch district. The ledge on the Pine Log, on Bear creek, near Valley Spring, is said to be 100 feet wide. A new pump will go in at the Royal at Hodson. The 4000-foot tunnel of the Melones M. Co. at Robinson's Ferry is completed. The vein matter is said to be rich in free gold and 100 feet wide.

The Mutual M. & M. Co. is pushing work on the Lucky Boy, near San Andreas. More men will be put on; B. Johnson Supt.

The two new turbines recently put in by the Utica Co. to run the Cross hoist, at Angels, were tested on the 3d inst. and found to work satisfactorily.

EL DORADO COUNTY.

The new hoist going in at the Springfield shaft of the Union, at Placerville, will have a capacity of going to the 3000-foot level. The shaft, now down 1600 feet, will be sunk to the 2200-foot level. At Kelsey work is in progress on the Reese & Roelke; the tunnel is expected to reach the shaft shortly. Ten men are employed at the Hart, near Placerville.

Water power will be used at the St. Clair at Kelsey, instead of steam. A pipe line will be put in.

The Cambrian, near Placerville, is shut down temporarily on account of water. A 350-foot tunnel is being driven to drain the mine, however. Supt. Clark has men tearing down the old mill at the

Church. A new mill will go in to replace it. The mill at the Hart Con., near Garden Valley, is running; Jones & Roberts, operators. Operations on the Starlight, near Placerville, are under way and drifting is being done on the 600-foot level; J. Vance, Supt. Work is resumed on the Mt. Pleasant.

Lane & Smart, operating the Shaw, near Placerville, have laid 4000 feet of 11-inch pipe to carry water to the mine, and cleaned out and enlarged the South Fork ditch to a capacity of 200 inches. The Toll House M. Co. is pushing work on the Toll House (gravel), at Smith's Flat.

HUMBOLDT COUNTY.

At the annual meeting of the Trophy M. Co. in Eureka J. N. Adams was elected general manager.

KERN COUNTY.

The Randsburg Ore Sampling & Buying Co., General Manager Stagg, will put up sampling works at Johannesburg. The work of rebuilding the new reservoir of the Yellow Aster Co. at Randsburg is completed. The Century Oil Co., operating in Kern River district, is down 1017 feet, in black shale. The McKittrick No. 2 is down 305 feet. The Superior Development Co., operating on the southeast quarter of 24, 28-27, near Bakersfield, is spudding. The well of the Clairmont Oil Co., operating on section 32, 28-28, Bakersfield, is down 350 feet. The Electric Oil Co. recently struck oil sand at a depth of 300 feet on 10, 29-28, Bakersfield. The Star Oil Co. of West Virginia, on 11, 30-21, Bakersfield, has put in a rig and will begin drilling operations shortly. The Elona Oil Co. will begin operations on section 19, 28-28; L. A. Ross of San Francisco manager. Well No. 4 of the Grace Oil Co. is down 450 feet. The Globe Oil Co. is perforating its No. 5 well hole, is down 900 feet, and 600 feet of oil stands in the casing. At Sunset the Raisin City Oil Co. on 31, 32-24 and Bennett & Stokes on 28, 32-24 are operating Canadian pole rigs. The well of the Raisin City Oil Co. is down 500 feet.

The county assessor has fixed the rate valuation on lands in the heart of the Kern River district at \$1000 an acre. Possessory interests will be considered personal property.

The California Standard Oil Co. has its No. 3 well at McKittrick down 750 feet.

The well of the 20 Oil Co., at McKittrick, is down 220 feet; 9½ casing is going in. The Empire Oil Co. will soon begin operations on the southwest quarter of 8, 30-22, near McKittrick.

MONO COUNTY.

In the Standard Con. mine, at Bodie, for week ending March 2, 418 tons of ore were crushed; average assay vanner tailings, \$7.95; concentrates produced, 1.14 tons; assay value, \$101.12; amalgam produced, 1190 ounces; value per ounce, \$2.23.

Supt. Kermeen reports operations progressing favorably in the Castle Peak mines, near Bodie, but says that the mill will not be started up again till May 1st.

NEVADA COUNTY.

The new mill at the Lecompton, at Nevada City, will start in April. Work is in progress on the new 10-stamp mill for the Campbell.

H. R. & R. D. Ogden, operating the Federal Loan, Willow, recently made a shipment of four tons of ore to the Selby Smelting & Lead Works, San Francisco.

Work is resumed on the Independence, near Graniteville; C. M. Root, Supt.

Hartman & Graham are running a new tunnel in the old Odin (gravel), on Washington ridge, near Nevada City. Good ore is coming out of the Providence. Fifty-three men are working. The mill is expected to be running to its full capacity shortly.

The Nevada County mill will run on ore from the Wyoming, near Nevada City, operated by Marsh Bros. and others.

PLACER COUNTY.

Operations are under way at the Pioneer, near Colfax; Supt. J. J. Sullivan. A new tunnel is being run on the Central (quartz). The Rawhide Con. M. Co. is running a new lower tunnel; two shifts are working. Work is being pushed on the Morning Star, at Iowa Hill.

PLUMAS COUNTY.

The Jamison M. Co., operating near Johnsville, has fifty men employed. Work is in progress in the Clay Bank tunnel, near La Porte. An 8-foot tunnel drain will go in at the Thistle Shaft, near La Porte.

SAN BENITO COUNTY.

The Hollister Crude Oil Co. has a derrick up near Hollister.

SANTA CRUZ COUNTY.

The Watsonville Oil Co. is reported to have refused \$300,000 for its leases near Watsonville.

SHASTA COUNTY.

A strike of rich ore is reported in the Hobo, in French Gulch district.

The North California Investment Co.,

operating the Black Diamond copper mine on Stillwater creek, Bada Becker manager, is driving a tunnel more than a mile long through the hill from both the western and Pitt river sides.

SIERRA COUNTY.

The Independence at Wolf Creek is bonded to Mr. Hall.

Supt. R. P. Mott is pushing work on the Mammoth Springs, east of Forest City. Twelve men are employed.

SOLANO COUNTY.

The Rochester Oil Co. will begin drilling for oil near Suisun.

SISKIYOU COUNTY.

The Helena (gold), in Callahans district, is producing forty tons of ore per day. Ore is crushed in the Kent mill, which has a capacity of forty tons daily; a cyanide department is added to the mill; Supt. McKeene. Seventeen men are employed in the Montezuma (gravel), near Callahans. Mahler & Schroder will begin operations on the Drummer Boy (quartz), in Cherry Creek district. Manager S. C. Matthews is pushing work on the Jordan (hydraulic), in Cecilville district, two plants being operated. It is expected to clean up \$16,000 this season.

Operations on the Junction (gravel), near Cecilville, are progressing under Supt. S. Conzeth. The Halleck drift mine will hereafter be worked as a hydraulic mine. It is reported that the Mt. Shasta M. Co. of Yreka may buy the Horton gulch placer mines, near Cecilville. The Brown & George (placer), Cecilville district, is bonded for \$2200. Operations are progressing steadily at the Kem Lee (gravel), in Greenhorn district.

Work will begin on the Ball (quartz), in Humbug district. The Jordan (copper), in lower Klamath district, is reported bonded to a foreign company for \$120,000. In Scott Valley district, the Helen Quartz M. Co. will soon begin work on its properties. Work is under way at the Kunz Flat (hydraulic), in Hamburg district.

Repairs to the flume and ditch of the Siskiyou (hydraulic), on the Klamath river, near Hamburg, are completed. The Golden Jubilee, at Humbug, is sold to L. W. Faquier. Operations are under way on the old Campbell or Oro Grande, Quartz Valley.

TRINITY COUNTY.

The Sykes M. Co. is getting the old Boss & McCleary, at Trinity Center, in shape for the spring run. The buildings for the new mill and cyanide plant going in at the Headlight, near Carrville, are nearing completion. A strike of good ore was recently made on the Yellowstone, in New River district.

TUOLUMNE COUNTY.

The Bonanza, near Sonora, was recently sold at sheriff sale to J. Cain. The Longfellow, at Big Oak Flat, and the Rhode Island, at Groveland, are running steadily. A new 20-stamp mill is to go in on the Mack, at Big Oak Flat, Supt. C. L. Lang, but only ten stamps will go in this spring. The Mt. Jefferson, at Groveland, 20-stamp mill will start up. The tunnel in the Over, near Columbia, is in 500 feet. High-grade ore is reported opened up in the Mt. Lily. The shaft at the Goldwin, near Carters, Supt. W. H. McClintock, will be sunk to the 400-foot level, at which depth drifting will be started; good progress is being made in construction of the new mill.

The tunnel in the Continental, near Columbia, is in 1000 feet. There are 200 feet of water in the Rawhide at Rawhide. Unwatering of the mine is under way.

The Dutch M. & M. Co. has increased the capacity of its plant at Quartz. Over 1000 feet of tunnel are run on the Continental, near Columbia, operated by C. B. Taylor. The Golden Gate at Sonora will increase its stamps from twenty to thirty; the Shawmut at Jamestown will increase from sixty to one hundred; the Republican at Jacksonville will increase from ten to thirty.

Work is under way in the lower tunnel of the Mayflower, Carters. The Kodak and Rising Sun mines, near Carters, are reported bonded to Los Angeles and San Francisco men for \$12,000.

COLORADO.

CLEAR CREEK COUNTY.

The 2-mile tunnel now being run into Covade mountain, near Empire, by the Empire Tunnel Co., will serve as the main channel of drainage and transportation for about seventy-nine known claims; it will be double-tracked and equipped with a car system capable of handling material removed.

At Georgetown last week the Atlantic-Pacific Ry. tunnel and all of the mining and mill site property of the company was sold at public auction at the court house by Commissioner W. L. Dayton of Denver to satisfy judgments for over \$700,000

secured by Mrs. Marie E. Hoyt, a bondholder. The entire property was bid in by J. E. Ratchford, a banker and capitalist of Syracuse, N. Y., for \$4100. The tunnel is now in 5300 feet on the east end. The total length of the bore as originally outlined was 25,250 feet, but by changing the length has been shortened 7000 feet. It is expected that the tunnel will be completed in two and one-half years, and the distance from Denver to Leadville by railroad through the tunnel thus shortened over 100 miles. The tunnel was started originally in 1880 by "Brick" Pomeroy, and \$700,000 has been spent in its construction.

The Stephens group, near Idaho Springs, is reported sold to the Golden Smelter Co. for \$2,000,000. The company will build a large water power plant on Clear creek, 3 miles west of Idaho Springs, and will run a tunnel south to cut the veins at depths of from 1000 to 1800 feet below the apex of the hill. Work on the new smelter of the company is progressing satisfactorily; four boilers and one blower are already on the ground; 100 men are employed.

FREMONT COUNTY.

In contradiction to a recent statement that from \$8 to \$10 gold per ton was found in the slag from the Rocky Mountain smelter, at Florence, Supt. F. R. Carpenter states that the highest value obtained from an assay of the slag was 40 cents per ton and that, as a rule, it does not exceed 20 cents per ton.

GILPIN COUNTY.

The Colorado Supreme Court has before it the case of Cleary vs. Skiffich. The plaintiff bought some years ago a mill site claim, which was located in 1860 and on which many thousands of dollars had been expended. In 1895 Skiffich secured a lode claim on a property which apparently included the mill site claim already being worked. A litigation followed and the court below decided that a lode claim, no matter how long after the date of a mill site claim was taken out, had precedence. This is the first time this point has ever reached the Colorado Supreme Court.

The Town Topics G. M. Co., operating the East Notaway, near Central City, will retimer its shaft from the 360-foot level to the 560-foot level. Levels are being extended and ore is being shipped; a new addition to the ore house is built; M. D. Draper, manager. E. W. Williams & Co., operating the Annie Mary and Pittsburgh & Meeker properties, in Russell district, are extending the 300 and 400 foot levels of the Pittsburgh & Meeker east and west. The West Notaway M. Co. of Chicago, Ill., is taking out smelting ore from the 350-foot level of the West Notaway, near Central City; Supt., H. F. Pool. The shaft in the National, at the head of Spring gulch, near Central City, operated by Lowe & Dines of Denver, is down 560 feet. During February 264 cars, or 5284 tons, of ore were shipped from Black Hawk. Supt. W. Job is pushing work on the Annex, in Lake district, near Central City. The shaft in the Puzzle, on Gregory mountain, is down 410 feet. Thirty men are employed; W. H. Tripp, Supt. Ore of smelting quality is reported at a depth of 550 feet in the O'Neil, on the summit of Gregory mountain, near Central City, operated by the Ontario-Colorado G. M. Co. Fifty men are employed.

The new broad, deep mortars recently put in the north section of the Gilpin 50-stamp mill, at Black Hawk, have proven a great improvement over those formerly used, and as a consequence five other batteries of same pattern will be put in.

GUNNISON COUNTY.

The Tomichi valley smelter, 3 miles below White Pine, will start up soon. The plant treats 1000 tons of ore per month, and is supplied by the North Star, Nest Egg, Eureka, Erie, Victor, Lily, Chicago and Pocahontas mines, in the Tomichi district; a new water jacket furnace will go in to replace one formerly used; R. H. Terhune, manager.

HINSDALE COUNTY.

The tunnel in the Golden Fleeces, at Lake City, is in 2400 feet.

LAKE COUNTY.

Supt. R. Hahnwald is pushing work on the Hap Hazard, at Lake Park. The Wolfstone, at Leadville, is now shipping 100 tons of ore daily.

The Zang Brewing Co. of Denver, operating the Eclipse, at Leadville, will sink a new shaft on the property. The new Printer Boy Co., operating the Printer Boy, will sink the old shaft, now down 850 feet, an additional 300 feet. The old Carbonate Hill Co.'s property, which has lain idle for fifteen years, will be reopened; the old shaft is down 400 feet. Operations on the Seeley shaft, on Poverty Flat, Leadville, will resume.

OURAY COUNTY.

A strike of rich ore was recently made

in second level of the Newsboy, at Ouray; ore is reported to assay from 600 to 1000 ounces silver to the ton.

PARK COUNTY.

The Parker interest in the Tenderfoot, near O'Brien City, is taken over by G. Ritter and associates for \$8000; two shifts will be put on and sinking of shaft continued. The Electric Co., of Chicago, has bonded 160 acres land at Reynolds station, in 11-mile canyon; the company intends to put in a mill.

ROUTT COUNTY.

Work is progressing under Supt. A. O. Young.

SAGUACHE COUNTY.

A strike of ore running \$358 to the ton is reported on Milwaukee hill, near Crestone. A new track and cargo in at the Banner tunnel, Crestone; a new air compressor and drills also go in soon; the tunnel will be pushed.

SAN JUAN COUNTY.

The Silver Ledge M. & M. Co., operating the Silver Ledge, near Silverton, will double the capacity of its mill and sink a 7x4 working shaft to a depth of 500 feet; at this depth 2000 feet of drifts, etc., will be run.

A mill will probably go in on the Aztec, in Needleton district this summer; Supt., J. Moore. In the Mastodon the upper drift is in 360 feet and the lower drift is in 90 feet; fourteen men are employed. E. Liston is pushing work on his group at the edge of Needle basin, 4 miles from Needleton. The drift being run on the Waterfall vein of the Blunt property is expected to cut the Bluff vein at a depth of 250 feet. The Colorado C. & G. M. Co., capital \$1,000,000, is incorporated at Silverton. Supt. C. E. McIntyre is pushing work on the Golden Fleeces, in Picayune gulch, near Silverton. W. D. Wells has begun work on the Magnet tunnel, near Burro bridge, Silverton.

SUMMIT COUNTY.

The Wilfey mine and mill, at Breckenridge, are running steadily; E. E. Byron, manager. Good ore is coming out of the Breene, on Elk mountain, near Breckenridge. Manager J. Groff is pushing work on the Reconstruction, on Copper mountain. The Maximus is closed down, owing to bad condition of roads. The El Dorado, at Robinson, is being unwatered through the East shaft. Sinking is in progress on the Ten-Mile and Half Moon claims.

TELLER COUNTY.

The shaft on the Wrockloff lease of the Acacia Co., Cripple Creek, now down 625 feet, may be sunk an additional 300 feet to strike the Burns vein. The Pointer, Cripple Creek, is shipping ore from the 625-foot level. The Cripple Creek Gold Exp. Co. has begun work on the east shaft of the May Belle, now down 146 feet and will sink it to the 500-foot level. Below present level it will be a three-compartment shaft, and when 500-foot level is reached the upper portion will be widened to same dimensions. The Union Bell M. Co. will sink its shaft to the 500-foot level. On Tenderfoot hill, Cripple Creek, the Bob Lee shaft, now down 200 feet, will go an additional 100 feet, at which depth drifting will be done. New 300 H. P. boilers will go in at the Legal Tender. During February the Dead Pine, operated by J. W. Phillips, shipped 100 tons of ore from the 700-foot level. A strike of good ore was recently made at the 527-foot mark in the tunnel of the Omega, on Gold hill, near Victor, operated by Carl & Morse.

The shaft on the Sundown, on Raven hill, Cripple Creek, is down 300 feet. The Union Belle M. Co., operating on Gold hill, Cripple Creek, will put in a new steam hoisting plant, including a 25 H. P. boiler and a 4x8 hoist. Standard & Co., operating block No. 3 of the Mountain Beauty, near Victor, have sunk the shaft to a depth of 150 feet; ore assays from \$50 to \$60 to the ton. Berg, Buechner & Perkins, operating block No. 2 of the Deadwood, Victor, recently realized \$2500 from a 10-ton shipment of ore; the cross-cut now being driven on the 650-foot level is in about 70 feet; it is expected to cut the ledge within the next 30 or 40 feet. The shaft on block No. 4 of the Kimberly, Cripple Creek, now down 175 feet, will be sunk to the 400-foot level; G. Bently, operator. The Economic mill, at Cripple Creek, is being cleaned up preparatory to treating what is said to be the largest tonnage of ore in its history.

IDAHO.

BANNOCK COUNTY.

Mr. Cowan, owning 300 acres of placer ground near Pocatello, on the Snake river, recently made a test run of the gravel over the vanners at the Strawberry mill, at Pocatello, and it is stated that results were such that not a color was left in the tailings. He will put up a plant this spring, using several 6-foot vanners.

IDAHO COUNTY.

The second payment on the Blue Jacket, near Grangeville, \$3500, is made. The new hoist put in last month, which is capable of going to a depth of 1000 feet, is running smoothly; drifting is in progress; twenty men are employed.

Operations on the Vesuvius, Buffalo Hump, will resume immediately; Supt. Stephens.

The second payment on the Blue Jacket, at Crooks Corral, amounting to \$3833, is made. A strike is reported on the Corson & Thompson property, in Crooks Corral district, of ore said to run \$20 gold and 15% copper.

NEZ PERCES COUNTY.

The Grand Ronde Power Co., a branch of the Vineland Co., will build a power house 25 miles above Lewiston and 3 miles from the mouth of the Grand Ronde river this year; by conveying water of the river in a canal for several miles the company expects to develop 5000 H. P., to supply electric light and power to the quartz and placer mines in the Salmon River and other districts up Snake river.

A mill and reduction plant will go in on the Gold Point M. Co.'s property, in Red River district, near Lewiston, this summer; J. D. Boyer, Supt.

Ore running \$69 to the ton is reported on the 250-foot level of the Silver King, on the Salmon river, 60 miles east of Warren.

OWYHEE COUNTY.

The Virtue Con. M. Co. of Montreal, Canada, owning and operating the Cumberland, on War Eagle mountain, near Silver City, has sixty men employed in mine and mill; resident manager, A. Buckbee.

SHOSHONE COUNTY.

The station being cut on the 160-foot level of the Amador, near Wallace, is completed. As soon as roads are in condition the Mascot, at Orofino, will resume operations.

A strike is reported made on the Chester, near Osburn, owned by Weber Bros., Wentz and Fairweather. The Terror Con. M. & M. Co., capital \$100,000, is incorporated, to work the De Gorges, Jean Ribault and Mary Mann, near Osburn.

The Mascot M. Co., operating near Pierce City, will put in a new hoisting plant and sawmill.

The tunnel being run by the Sister M. Co., near Wallace, is in 300 feet.

MICHIGAN.

HOUGHTON COUNTY.

The Champion M. Co. will build a new mill on the Champion, at Houghton. The Adventure, at Houghton, will put in three heads and necessary washing machinery; also, a new 60-drill air compressor.

The annual report of the Tamarack M. Co. (Lake copper producers) for year ending Dec. 31, 1900, shows:

	Revenues—	
	1900.	1899.
Receipts from copper.....	\$3,299,077	\$2,952,098
Costs of copper.....	2,099,935	2,211,588
Total	\$1,199,142	\$740,510

	1900.	1899.
Rock hoisted, tons.....	766,058	775,532
Rock stamped, tons.....	625,422	631,090
Cost of stamping p. ton.....	34.479c	23.727c
Mineral obtained, lbs. 31,738,495		31,713,752
Refined copper, lbs.....	20,512,590	20,033,576

The actual cost of mining and treating rock was no less in 1900 than in 1899, but the increase of 1% of fine copper in the rock stamped and the high price obtained for copper during 1900 permitted the raising of dividends from \$10 in 1899 to \$17 per share in 1900. The cost of producing copper in 1900 at the Tamarack works was 10 3/4 cents, against 11.05 cents in 1899 and 9.31 cents in 1898. The average selling price in the three years was 16.24, 14.76 and 11.9 cents per pound.

The annual report of the Atlantic M. Co., Houghton, for 1900 shows that the copper realized 16 1/4 cents per pound; the yield was 12.04 pounds per ton of ore crushed. The \$130,000 steel dam, now being built, is expected to be completed this summer.

MONTANA.

DALY COUNTY.

At Helmsville, Supt. Little is pushing work on his property; high-grade ore is being shipped. It is said that a Cripple Creek, Colo., company will put in a customs 10-stamp mill at Helmsville. On the 8th inst. Gov. Toole signed the bill changing Powell county to Deerlodge, and what was formerly Deerlodge county to Daly.

FERGUS COUNTY.

On the Weatherwax, in Skunk gulch, near Yogo, ore which was formerly worked with an arrastra is now of a smelting quality. Carter & Settler, operating near Yogo, have run a 140-foot tunnel;

vein is 6 feet wide.—The Christopher Columbo and Josephine claims, on the divide between Dry and Running Wolf creeks, near Yogo, are being worked by C. Lehman of Lewiston. Ore from the Christopher Columbo is silver-lead, running \$28 to the ton. Two shafts, 80 and 50 feet deep, are sunk and a 700-foot tunnel is run. A diamond drill will be put in on the property this summer.—The Kendall property, in the North Moccasins, bonded to Campbell & Fitch for \$450,000 till May 1st, is being developed.

GRANITE COUNTY.

A New York company will work property near the Granite, near Rumsey; a 200-foot tunnel will be run.

JEFFERSON COUNTY.

The Basin & Bay State M. Co., owning the Katie mine, concentrator and smelter, at Basin, will issue \$300,000 worth of bonds in order to raise that amount of money to begin operations with this year. The concentrator has a capacity of 500 tons of ore daily, and the smelter has a capacity of 250 tons. Shaft on property is down 500 feet.—The Ada, at Basin, is to be sold to E. S. Brown and H. W. Carter, of Springfield, Mass.

The Ada, in Cataract district, bonded to Springfield parties for \$180,000, will be taken over by them on the first payment of \$50,000. Since last September \$22,000 worth of ore has been taken out.

MADISON COUNTY.

The Lake Shore M. Co., driving cross-cut tunnel near Sheridan, expects to cut the lead within the next 100 feet.—Thirty-five tons of ore were recently shipped from the Keynote, in Georgia gulch, near Sheridan, to the smelter at East Helena. The property is operated by Pritchett & Eastridge.—McQueeney & McIsaacs, of Butte, may lease the Green Castle, on upper Wisconsin creek, near Sheridan.—Another body of ore is reported opened up in the Toledo shaft.—Thompson & Wiseman, operating the Buckeye No. 1, at Brandon, are shipping ore.

The Old Joe 10-stamp mill, near Pony, operated by the Salt Lake M. & D. Co., recently made a ten days' run which netted \$1500.—Operations are under way on the Fourth of July group, near Pony; Supt. H. T. Bragdon.—A new air compressor and hoisting plant are in at the Chili at Sand Creek. The shaft will be sunk several hundred feet.—The Red Bluff at Red Bluff, 3 miles from Norris, now being operated by the Montana G. M. Co. of Canada, is being unwatered. A new compressor is in and plans are under way for the erection of a 100-ton reduction plant; G. D. B. Turner, manager.—The Red Chief M. Co. is pushing work on the Red Chief and Water Lode mines, 1 mile from the Red Bluff; Sherman & Schmidell, managers.—Two men are working on the Revenue at Richmond Flats.

PARK COUNTY.

The Bear Gulch M. Co., operating the Legal Tender, at Bear Gulch, is pushing work on the property.—It is stated that about \$500,000 have been taken from the Souwash, Bear Gulch, within the last two and a half years.

SILVER BOW COUNTY.

The Butte M. & Dev. Co., operating the Emma, at Butte, is putting in two additional 80 H. P. boilers and an engine with a capacity to go down 1200 feet; a safety cage and additional pumps will also go in shortly; good progress is being made in sinking the shaft, which will go to the 1000-foot level.

The annual report of the Boston & Montana C. & S. M. Co. of Butte for 1900 shows the following:

Gross receipts.....	\$13,242,576
Montana expenses.....	\$4,241,895
Eastern expenses.....	807,828

Total expenses..... 5,049,724

Net..... \$8,192,852

NEVADA.

EUREKA COUNTY.

During week ending March 8, following shipments of ore were made from mines at Eureka:

Mine.	Pounds.
Bullwhacker.....	71,670
Diamond.....	80,390
Eureka Con.....	176,200
Excelsior.....	39,600
Helen.....	5,480
Jackson.....	68,790
Richmond.....	226,290

Total..... 668,420

HUMBOLDT COUNTY.

A strike of rich ore is reported made in the Gold & Silver at Trinity, near Lovelock.—Work on the Numa at Trinity, owned by Mr. Elsworth of San Francisco, will be resumed.

LINCOLN COUNTY.

The Quartette M. Co., comprising Boston parties, have twenty-four mining claims, divided into three different groups, in the Searchlight district, with a 20-stamp mill, equipped with plates and concentrators, on the Colorado river, 12 miles distant. The mine and mill work is under the superintendence of Benjamin Macready. The three groups of claims are not contiguous, though separated from each other by only 2 to 3 miles. Developments are being carried on through four shafts, at present of depth of 377, 220, 200 and 100 feet respectively; also through a tunnel driven 500 feet. From each shaft various levels have been run, aggregating several hundred feet. The ores, in the main, comprise free-gold quartz, with streaks of lead and copper sulphides. The veins vary as to trend. Some of them, however, run parallel to each other. The power consists of an oil-burner engine at one shaft, an ordinary steam boiler and engine at another, with steam power at the mill. The mill started in six weeks ago, the capacity of which may be doubled the present season. The table tailings are being impounded with the idea of cyaniding them later on.

Searchlight, March 1.

STOREY COUNTY.

The Occidental Con. M. Co. will demand \$127,292.25 damages of the Comstock Tunnel Co. Should payment be refused, it will bring suit for the recovery of that amount; \$27,292.25 of the sum is the amount paid by the Occidental Con. M. Co. to the Comstock Tunnel Co. under contracts for running the Zadig drift on the tunnel level; the remaining \$100,000 represents the damage alleged to have been sustained from preventing the Occidental Con. M. Co. from working in that drift.

WASHOE COUNTY.

A strike is reported made on the Bellmare property at Cottonwood, near Reno. The company is running a 1500-foot tunnel, which is expected to cut the ledge at a depth of 500 feet.

The Crown Prince and Jones & Kinkaid mines at Pyramid are sold to M. D. Young & Co. of New York for \$40,000, to be paid in two years in two equal installments. The purchasers expect to begin work at once.

WHITE PINE COUNTY.

The final payment of \$50,000 on the Chainman, at Ely, is made.—The Union Jack, in Osceola mining district, is reported sold to Butterfield G. M. & M. Co. for \$6000.

NEW MEXICO.

COLFAX COUNTY.

A new pump and large gasoline engine are going in on the Denver placer property near Elizabethtown; Manager Walsh.—The Kelling Co. will put in dredging machinery on its property near Elizabethtown.—The Montezuma Co. is working the Hardscrabble and Billie B. properties, near Elizabethtown.

LINCOLN COUNTY.

The Old Abe M. Co. is pushing work on its coal property near White Oaks.

OREGON.

BAKER COUNTY.

Good ore is being taken out of the Big Blue, near Pleasant Valley.

JACKSON COUNTY.

The hoisting and pumping station at the Ashland, near Ashland, is being changed to the 250-foot level.—The Granite Mountain M. Co., capital \$40,000, is incorporated at Jacksonville.

JOSEPHINE COUNTY.

The McIntosh placers on Coyote and Wolf creeks, near Grants Pass, are being operated by G. B. Perelli.—The Victor, Jr., mine and 15-stamp mill near Grants Pass are running steadily; fifty men are employed, and monthly output is given at between \$30,000 and \$40,000.—Supt. A. Howland reports giants running steadily on the Davis (hydraulic) in Jump-off-Joe district.—W. H. Hampton, operating the Columbia, at Placer, reports mining operations active in that district, water being abundant.

UMATILLA COUNTY.

The Independence M. Co., capital \$2,000,000, is incorporated to work claims near Mountain Home, 28 miles south of Pendleton.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Comparison of processes now used in the Black Hills shows the following results:

Process.	Per ct. saved.
Amalgamation.....	75
Smelting.....	95
Chlorination.....	92
Cyaniding.....	80 to 92 gold 65 silver

It is estimated that a 100-ton per day

cyanide plant can be erected in the Black Hills for about \$27,000, the running expenses of which would be about as follows:

LABOR.

Two engineers, \$3.50 per day.....	\$ 7 00
Two firemen, \$3 per day.....	6 00
Two crusher men, \$3 per day.....	6 00
Two men on rolls, \$3.50 per day.....	7 00
Two solution men, \$3 per day.....	6 00
Four pulp men, \$3 per day.....	12 00
One chemist, \$5 per day.....	5 00
One assayer, \$3.50 per day.....	3 50
One helper, \$2.50 per day.....	2 50

Total.....\$55 00

The cost per ton of ore for treating would be:

Labor.....	\$ 55
Cyanide.....	30
Coal.....	30
Zinc.....	10
Repairs.....	10
Incidentals.....	10

Total.....\$1 45

The Hidden Fortune and other claims near Lead, recently sold to Mayham, Stevenson & Shaw, of Denver, Colo., will be worked on a large scale by the new owners. A 400 foot three-compartment shaft will be sunk and a 400-foot crosscut east and west will be run at that depth. A 200-ton cyanide plant will be built at Belle Fourche, on the Fremont, Elkhorn & Missouri Valley railroad, 30 miles distant.

TEXAS.

EL PASO COUNTY.

Phelps, Dodge & Co. contemplate the erection of a smelter at El Paso.—Work on the new custom smelter of the Federal Copper Co., at El Paso, will soon begin.

UTAH.

BEAVER COUNTY.

Work on the Horn Silver, at Frisco, is under way under Manager Farnsworth.

BOX ELDER COUNTY.

The Century mill, at Park Valley, is running steadily, and regular shipments of bullion are being made.

JUAB COUNTY.

It is probable that the Joe Bowers M. Co., operating near Diamond, Tintic district, will pay off its indebtedness and begin work soon.—The Alaska M. Co., operating the Alaska, near Tintic, is drifting on the 450-foot level.—Crosscutting is under way on the 1000-foot level of the Ajax, at Tintic; Manager Weir.—The Shoebridge Bonanza M. Co., Tintic, is crosscutting on the 525-foot level of the Shoebridge-Bonanza.—The main incline in the Martha Washington will go to a depth of 700 feet; Supt., S. Baldwin.

The main working shaft in the Gemini, at Eureka, is down 1630 feet; a winze was recently sunk at a point 100 feet in on the 1600-foot level, and a drift is being run from bottom of same underneath main shaft.

Manager S. Bamberger reports ore from the Lower Mammoth at Tintic running 12% copper, twenty ounces silver and about \$2 gold to the ton; good progress is being made in driving tunnel on 885-foot level and vein is expected to be cut within the next month.—Ore carrying copper, silver and gold is reported opened up on the 450-foot level of the Martha Washington, at Tintic.—The Argenta Cop. M. Co., capital \$500,000, is incorporated to work the old Dana group, consisting of the June, Turk, Daisy, Eastern, Dewdrop and Marcus claims. The main shaft on the property is down 200 feet.

Another cave is opened in the Black Jack at Tintic on the 500-foot level.—The Stockton group and Lake View, Tintic, are reported sold to G. A. Robinson, representing the Tintic M. & D. Co., for \$20,000.

The new mill at the May Day, Tintic, will operate in April.—Work is resumed on the Dagmar-Eureka, W. H. Moeller, Supt. The company has options on the Missouri Lass and Free Coinage, and is negotiating for the Revenue.—The Home Rule and the Robert E. Lee claims, Tintic, are reported sold to the Little Chief M. Co., the former for \$15,000, \$2500 to be paid within one year, and vendors accept 2000 shares of Little Chief stock at 16 cents per share as earnest money, balance to be paid within two years.—The Godiva-Sioux Mountain M. Co. is incorporated to work the Uncle Sam-Godiva vein in the Smuggler ground.—The Argenta Copper Co. is incorporated to work the Dana group of six claims, near the Dragon Iron, at head of Dragon Hollow, Tintic.

SALT LAKE COUNTY.

The Dewey mill, at Bingham, is closed down temporarily, owing to bad condition of roads; manager, R. Bemis.—The Highland Boy smelter, at Bingham, is now treating about 500 tons of ore daily. During last week Supt. R. White shipped

240,400 pounds of copper, gold and silver bullion to Eastern refineries.

An additional battery of five stamps will be put in at the Butterfield mill at Bingham.—The Copper Boy, Great Chief, Copper Queen, Copper Boy No. 2, Florence C., Gracie C. Fraction, Copper Queen No. 2, O. K. Fraction and East Extension of the Butte & Boston, near Bingham, are sold to the Bingham Copper Boy M. Co.—The new Mingo smelter at Sandy is in operation.

Shipments of ore from Bingham last week were 994 tons.—The New England C. & G. M. Co., operating the Nast group, has decided to build a concentrator in Muddy gulch, below the Last Chance mill, this spring.

SUMMIT COUNTY.

Work on the Bogan group, at Park City, will begin; shaft, now down 590 feet, will be continued to the 800-foot level.—An assessment of $\frac{1}{2}$ cent per share is levied by the East Valeo M. Co., to enable company to pay off its indebtedness and push work.—A new engine, boiler, air compressor, etc., will go in at the Quincy, and at the California.—Shipments of McGregor ore from the old Crescent mill dump, consisting of about 400 tons, to Canyon City, Colo., are completed.

TOOELE COUNTY.

Operations at the Overland, at Sunshine, are progressing satisfactorily; mill is treating 450 tons of ore daily; manager, G. A. Duncan.

The new 150-ton per day roasting plant of the Sacramento at Mercur is in operation.

The mill of the Con. Mercur M. Co., at Mercur, treated 2200 tons of ore during the month of February. The roasters, which were made out of the old Brown driers at a cost of about \$5000, are now treating about 620 tons of sulphide ore daily, and the putting in of the three new Jacking roasters, which was contemplated some time ago, is indefinitely deferred.

G. B. Sessions, Supt. West Argent, at Stockton, reports galena ore on the 400-foot level which assays 20.5% lead and fifty-one ounces silver to the ton.

WASHINGTON COUNTY.

Thirty tons of copper bullion were recently shipped from the Dixie smelter at St. George, being the result of a fifteen days' run. Supt. Snyder will start another run.

WASHINGTON.

FERRY COUNTY.

The Wilmot group of ten claims, on Silver creek, near Keller, is sold to the Loraine Copper M. Co. of Hoquiam; work is under way and shipments of ore are expected to be made within three months.

It is reported that an offer of \$375,000 was recently made for the Chico, at Republic.

Some of the ore opened up in the up-raise being run from the second to the first level of the Morning Glory, at Republic, assays \$1000 to the ton; Manager Tate.—The Wauconda tunnel, at Republic, now in 475 feet, is going ahead at the rate of 6 feet per day; Supt. Hedges.—The shaft on the Clackamas, Republic, is down 75 feet, and sinking is progressing at the rate of 3 feet per day.—The 400-foot shaft in the Quilp, Republic, is completed and a station cut at that depth. Drifting is in progress on the 300-foot level; ledge is 8 feet wide and ore runs \$30 to the ton; Supt. Crummer.

SPOKANE COUNTY.

The Diadem M. & M. Co., capital \$12,500, is incorporated at Spokane.

STEVENS COUNTY.

Supt. M. Mitchell of the Eagle, at Chewelah, reports opening up of good silver-lead ore on 120-foot level, also that shipments of ore will be made as soon as roads will permit.

Ore running 30% lead and twenty-two ounces silver to the ton is found in the Anaconda, on Red Top mountain, near Colville.—Operations on the Little Giant, in Pierre Lake district, near Colville, will resume shortly.—Operations are progressing satisfactorily at the Copper King, near Colville.—The new pumps, hoists, etc., going in on the Gold Bug, near Colville, are about placed; Supt. F. W. Morris.

The first payment on the Acme group, near Kettle Falls, is made by the Northwest M. Co. of San Francisco. A 1300-foot tunnel will be run to tap the ledge at a depth of about 800 feet; manager, W. F. Stevens.

WYOMING.

CARBON COUNTY.

Operations on the property of the Beulah Copper M. Co., near Battle Lake, are begun; a tunnel will be run and work will be pushed; Supt., J. F. Ledbetter.

FREMONT COUNTY.

Asbestos is reported at foot of Rattle-

snake range of mountains, near Lost Cabin, showing a fiber 8 inches in length.

FOREIGN.

BRITISH COLUMBIA.

Reports from the Ymir, at Ymir, for February show the following: Number of stamps dropped, 80; number of hours run, 611; number of tons ore crushed, 4900; number of tons concentrates produced, 447; total receipts for bullion, \$41,600; total operating expenses, \$15,400; net profit, \$26,200.—Ore running \$12 to the ton is reported in the tunnel in the Ocean Wave at Ymir.—The Snowdrop (marble) on Sheep creek, 7 miles from Salmo, is reported sold to W. Shackleton and G. Simpson of Nelson.—Twenty-three tons of ore recently shipped from the Wilcox, at Ymir, returned \$57 to the ton.—Work is begun on the new mill of the Enterprise, Ten Mile.

The Boxer group, consisting of the Boxer, Ophir, Monadnock Fraction, Neglected and St. Alice claims, at the head of Ten-mile creek, near Slocan, are bonded to L. A. Thurston, representing outside parties, for \$40,000, for eighteen months.

MEXICO.

The Sulphur M. & Ry. Co. propose to build a smelter at Carbonera, Cerrillos district, San Luis Potosi. The company will make a specialty of the reduction of sulphurous ores and the treatment of the by-products.

SOUTH AFRICA.

The British government has authorized the Chamber of Mines at Johannesburg to start 350 stamps.

Commercial Paragraphs.

THE Hendrie & Bolthoff Mfg. & Supply Co., Denver, Colo., write that the recent fire destroyed only one of their six warehouses, and that there will be no delay in filling orders.

THE A. Van der Naillen School of Mining Engineering of San Francisco has been compelled to move from 933 Market St., on account of increased attendance, requiring enlarged facilities, and now occupies its own three-story building, 113 Fulton St., one block west of City Hall.

JEANESVILLE IRON WORKS Co. report now building for the Vindicator Gold Mining Co., at Independence, Colo., a compound condensing pump, 1200 feet direct lift, to be the highest direct lift in that State. The Jeanesville in the Ibox, Colo., mine is the next highest lift, 1100 feet. The Gower Syndicate, Black Hawk, Colo., has put in a Jeanesville 800 feet lift.

THE Robert Aitchison Perforated Metal Co. of Chicago report an excellent run of business. They have recently made shipments to Kentucky, Wisconsin, Utah, Nebraska and other States. Shipments cover material for railroads, agricultural implements, breweries and other industries. Among recent inquiries are some from Australia, Germany and the West Indies.

THE S. H. Supply Co., have bought and are now dismantling the milling plant of the Gold Brick Milling Co., at Ohio City, Colo. This was a 20-stamp, dry crushing, silver mill, using the amalgamating process after the ore was roasted and desulphurized. The mill was in operation about one year, the ore giving out and company troubles causing a suspension, after which it was purchased by the above firm who are constantly dismantling mills and buildings throughout the west.

WORK is progressing on addition, 90x220 feet, to the James Lefell & Co. plant, Springfield, Ohio, to be built of brick and steel, and equipped with electrical cranes and new machines to enable them to supply the demand for their Samson wheels. These works will now give work for 300 men. The company has an order for a large pair of horizontal wheels from Minneapolis, to develop 3000 H. P.; and another contract for ten 68-inch Samson wheels from Michigan, for driving electrical machinery.

Trade Treatises.

Part 5, Vol. I, The Ericsson Series; illustrated treatise on transposition of wires; Ericsson Telephone Co., 296 Broadway, New York City.

No. 7, American Engineering Works, 204 Dearborn St., Chicago, Ill., describing machinery and supplies for mining, milling, smelting and concentration.

No. 23, the Victor turbine, of equal typographic merit and painstaking detail to that mentioned above, tables, diagrams, sectional views, statistics, references, etc. The Stillwell-Bierce & Smith-Vaile Co., Dayton, Ohio.

The 1901 catalogue, No. 13, of the Jackson hand power rock drill and equipment; finely illustrated description of the Jackson drill, with prices, and eight pages of testimonials from users. It is issued by

H. D. Crippen, 52 Broadway, New York City; western office, 1756 Larimer St., Denver, Colo.

Section 2 of "Mining Machinery," a superb production, illustratively descriptive of concentrating machinery, mills and appliances, replete with up-to-date details, conveniently indexed and in every way valuable. The two engravings of Hartz jigs, on pages 250 and 251, are splendid specimens of the engraver's art. The Edward P. Allis Co., Milwaukee, Wis.

Personal.

J. H. HAMMOND is in Salt Lake, Utah.

J. B. TAYLOR of Salt Lake, Utah, is in Flagstaff, Ariz.

I. A. JACOBSON is appointed Supt. Ben Butler, Bingham, Utah.

J. A. CUNNINGHAM of Tintic, Utah, has returned there from the East.

A. B. HALL now has charge of the Mineral Hill property, Ballarat, Cal.

S. C. IRVING has been elected president Mechanics' Institute of San Francisco.

W. D. HAWLEY of Grass Valley, Cal., is now Supt. Rawhide mine, Rawhide, Cal.

E. L. LEAVER of Salt Lake, Utah, has returned there from Cripple Creek, Colo.

GEORGE KISLINGBURY is examining mining property in the State of Guerrero, Mexico.

C. H. BRUNNER of Fremont, Neb., is in Salt Lake, Utah; from there he goes to Oregon.

SUPT. T. R. GARNIER of the Osceola, Alleghany, Cal., has returned there from Los Angeles.

CHARLES M. SCHWAB, president of the United Steel Combine, gets \$1,000,000 annual salary.

D. C. DEMAREST, manager Angels Iron Works, Angels, Cal., has returned from San Francisco.

J. F. TENER, general manager Duquesne M. & R. Co., Nogales, Ariz., is in Pittsburgh, Pa.

PRES. J. G. JACOBS of the Copper Belt Ry., has returned to Bingham, Utah, from Los Angeles, Cal.

W. L. CLARK is Supt. Lowell & Arizona Copper Co., Bisbee, Arizona, vice F. C. Penner, resigned.

D. I. NICKERSON, Supt. Butte & Boston, Republic, Wash., has returned there from Hailey, Idaho.

EDWIN E. CHASE, M. E., Denver, Colo., has moved from 509 Mining Exchange to 824 Equitable Bldg.

B. HOLDEN, managing director United States M. Co., Bingham, Utah, sails from Europe for this country on the 20th inst.

H. W. TURNER, U. S. G. S., has returned to San Francisco from a two months' exploration trip through Michoacan, Mexico.

WM. MAGENAU has left the employ of the Cia Minera de Penoles of Mapimi, Mexico, and is now engineer and assistant Supt. Columbus Lead Co., Esther, Mo.

J. G. BLACK of Dunedin, N. Z., who was at Angels, Cal., working on a plan to extract gold from sulphurets without the use of chlorine gas, at the Lightner plant there, returned this week to New Zealand.

PRES. G. A. RUSSELL of Springfield, Mass., Treasurer W. O. Day of same place, Secretary W. E. Colley of Providence, R. I., and Directors G. B. Holbrook and E. P. Chapin of Springfield, Mass., all of the Basin & Bay State M. & M. Co., are in Basin, Mont.

L. M. RICE of Seattle, Wash., is selecting the route and making the survey for an electric railway between the towns of Greenwood and Phoenix, B. C. It is intended that the road shall carry ore from the mines at Phoenix to the smelters at and near Greenwood, as well as for passenger traffic.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

METHOD OF SHAPING SHEET METAL BY HYDRAULIC PRESSURE.—No. 669,279. March 5, 1901. C. H. Harrington, San Jose, Cal. Assignor to F. L. Argall and W. C. Anderson, same place.

This invention is designed to utilize the well-known inelastic and mobile quality of liquids under pressure to form ductile, tensile or flexible material into any desired shape by means of molds, dies or formers, in contact with which the material to be shaped is placed and afterwards subjected to the heavy pressure or sudden impact transmitted through the body of water with which the parts are surrounded.

An Assaying Device.

The assaying device herewith illustrated may be made wholly or partly of glass; there should be sufficient part of it of glass to permit viewing the sand and metal therein.

The device comprises a bottle-shaped receiver having an oval outlet opening, a removable closure therefor, rifles at the inner side of one of the walls, a magnifying glass in the opposite side wall and a closure for an opening in the wall having the rifles.

In operation a small quantity of crushed ore or sand containing gold, etc., is placed in the device with a small quantity of water, whereupon, if side 3 be held down-

ward, and the device rocked back and forth, it is designed that the heavy particles containing the gold or other values shall sink to the bottom, the water and sand to flow out at the open end. It is intended that the crushed ore or sand remaining therein in a moist state shall then be allowed to run down and evenly distribute over the smooth concave side, with the idea that particles of precious metal may then be easily distinguished by looking through the magnifying or plain glass. It is the belief of the inventor that "with the amount of sand known and the number of gold particles obtained, a fairly accurate idea may be formed of the value of the ore in free gold, and this may be repeated over different parts of the ground."

The inventor is Archibald Campbell, Surf, Cal.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING MARCH 5, 1901.

- 669,276.—MINING MACHINE—A. Allen, Spokane, Wash.
- 669,227.—TIRE TIGHTENER—C. A. & G. A. Anderson, Portland, Or.
- 669,210.—ICE LOCOMOTIVE—C. E. S. Burch, Seattle, Wash.
- 669,196.—VALVE—Chaplin & Falk, S. F.
- 669,137.—HAND STAMP—F. W. Dobbels, S. F.
- 669,198.—ADVERTISING DEVICE—Fowler, Owen & Metcalf, Seattle, Wash.
- 669,279.—SHAPING SHEET METAL—C. H. Harrington, San Jose, Cal.
- 669,460.—HAIR CURLER—A. Haug, S. F.
- 669,167.—ADDING MACHINE—A. Hoch, Alameda, Cal.
- 669,168.—ADDING MACHINE—A. Hoch, Alameda, Cal.
- 669,421.—FIRE EXTINGUISHER—G. J. Luce, S. F.
- 669,266.—DUMB WAITER STOP—Pierce & McMahon, S. F.
- 669,431.—GATE—J. R. Scrafford, Corvallis, Or.
- 669,189.—GAS BURNER—A. C. Swain, S. F.
- 669,374.—GAME—C. W. Tarbet, Golden-dale, Wash.
- 669,451.—CITHERNS—W. A. Thaldorf, New Whatcom, Wash.
- 31,156.—DESIGN—W. F. Schmidt, Blanco, Cal.

Latest Market Reports.

SAN FRANCISCO, March 14, 1901.

SILVER.—Per oz., Troy: London, 28 $\frac{1}{2}$ d (standard ounce, 925 fine); New York, bar silver, 61 $\frac{1}{2}$ c (1000 fine); San Francisco, 61 $\frac{1}{2}$ c; Mexican dollars, 50c.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.50; Casting, 1 to 3 casks, \$16.65; carload lots, \$16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22 $\frac{1}{2}$ 3c.

LEAD.—New York, \$4.37 $\frac{1}{2}$; Salt Lake City, \$4.00; St. Louis, \$4.20; San Francisco \$5.00, carload lots, 5 $\frac{1}{2}$ c 1000 to 4000 lbs.; pipe 6 $\frac{1}{2}$, sheet 7 $\frac{1}{2}$, bar 6c; pig, \$4.70 @5.10. London, £13 15s per ton=3 cts. per lb.

SPELTER.—New York, \$4.00; St. Louis, \$3.50; London, £17 per ton=3.7 cts. per lb; San Francisco, ton lots, 5 $\frac{1}{2}$ c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9 $\frac{1}{2}$ c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, \$15.00; gray forge, \$14.25; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$21.75; open hearth billets, \$25.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.50; San Francisco, ton lots, 29c; 1000 lbs., 29 $\frac{1}{2}$ c; 500 lbs., 29 $\frac{1}{2}$ c; less, 30c; bar tin, \$3.35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 \$ flask of 76 $\frac{1}{2}$ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 \$ lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5 $\frac{1}{2}$ c; slab, 5 $\frac{1}{2}$ c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18 $\frac{1}{2}$ c; San Francisco, Plumbers', 100-lb. lots, 15 $\frac{1}{2}$ c.

ASSAY LITHARGE.—San Francisco, 10c \$ lb., small lots.

BISMUTH.—New York, \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 \$ lb.

PLATINUM.—San Francisco, crude, \$17 \$ oz.; New York, \$18.20 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, \$9.95c; San Francisco, \$11.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c \$ lb.

PHOSPHORUS.—F. o. b. New York 50@60c \$ lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 $\frac{1}{2}$ c; less than one ton, 17 $\frac{1}{2}$ c. No. 1 $\frac{1}{2}$, 60%, carload lots, 13 $\frac{1}{2}$ c; less than one ton, 15 $\frac{1}{2}$ c. No. 1** 50%, carload lots, 11 $\frac{1}{2}$ c; less than one ton, 13 $\frac{1}{2}$ c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9 $\frac{1}{2}$ c; less than one ton, 11 $\frac{1}{2}$ c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11 $\frac{1}{2}$ c \$ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32 $\frac{1}{2}$ 3c \$ lb.; carloads, 30@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66 $\frac{1}{2}$ B, 2c \$ lb.; soda ash, \$1.90 \$ 100 lbs. 58%; hyposulphite of soda, 2 $\frac{1}{2}$ @3c \$ lb.; blue vitriol, 5 $\frac{1}{2}$ @6 $\frac{1}{2}$ c \$ lb.; borax, concentrated, 7@8c \$ lb.; chloride of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2 $\frac{1}{2}$ @2 $\frac{1}{2}$ c; California refined, 1 $\frac{1}{2}$ @2c; nitric acid, in carboys, 8c \$ lb.; caustic soda, in drums, 3@4c \$ lb.; Cal. s. soda, bbls., \$1.00; sks, 95c \$ 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

OILS.—Linsed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14 $\frac{1}{2}$ c; do., cs., 20 $\frac{1}{2}$ c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13 $\frac{1}{2}$ c; do., in cs., 19 $\frac{1}{2}$ c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50@52 $\frac{1}{2}$ c; cs., 55@57 $\frac{1}{2}$ c.

FOR SALE.

FOR SALE. ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Hannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

MACHINERY BARGAINS.

I have some splendid Air Compressors, Hoisting Engines, Rock Drills, Rock Crushers, Channeling Machines, Steam Pumps, Boilers, Steam Shovels, Locomotives and Relaying Rails, all in splendid condition. Send for printed list and specify your requirements. I can save you money.

WILLIS SHAW,
627 New York Life Bldg., CHICAGO.

FOR SALE.

20-Stamp Mill.

Strictly Modern.

Little Used.

Built by Fraser & Chalmers.

ANY PART OF THIS MILL WILL BE SOLD.

This 20-stamp mill is located at Ohio City, about 25 miles east of Gunnison, Colorado. We are dismantling this mill for shipment to Denver and will quote prices on any part of the mill f. o. b. cars Ohio City, Colorado, and guarantee to make prompt shipment. The construction of the mill was of the best, both in machinery and buildings. The total cost of machinery and buildings, which we have bought, was \$130,000.00. Why was it sold? Simply another case of a mill without a mine. All correspondence should be addressed to our Denver office.

20 STAMPS. 850-lb. rapid drop, complete with frames.

2 BOILERS, 44 in. x 12 ft.; 30 3/4 in. flues.

2 BOILERS, 44 in. x 12 ft.; 34 3/4 in. flues.

(Boilers are set in batteries of two, half fronts, two stacks.)

CORLISS ENGINE, Fraser & Chalmers, 175 H. P.; cylinders 18x42 in.

FEED WATER HEATER, 30 in. x 9 ft. (F. & C.)

NO. 5 KNOWLES PUMP, 7x4 1/2 x 10.

NO. 3 KNOWLES PUMP, 5x3 1/4 x 7.

BLAKE CRUSHER, 7x10.

6 AMALGAMATING PANS, 5x4 ft.

3 SETTLERS, 8x3 ft. 4 in.

1 CLEANUP PAN.

4 QUICK FEEDERS.

3 AMALGAM SAFES.

1 AMALGAM CAR.

2 MEECH SYNDIATORS, new.

2 MEECH AMALGAMATORS.

3 MEECH SETTLERS.

HOWELL IMPROVED WHITE ROASTING

FURNACE, 60 in. x 27 ft.

BANCROFT PULVERIZER, 40-ton.

REVOLVING ORE DRYER (F. & C.), 42 in. x 18 ft.

6 AUTOMATIC ORE FEEDERS.

1 RETORT AND BULLION FURNACE.

EXTRA STAMP AND FEEDER REPAIRS.

250 FT. SHAFING, 4 7-16, 3 15-16, 2 15-16 dia.

1200 FT. RUBBER BELTING, 18, 16, 14, 12, 10, 6

and 4 in. widths.

4 CONVEYOR BELTS, with buckets attached.

50 IRON PULLEYS, BOXES, AND HANGERS.

10-TON FAIRBANK WAGON SCALE.

3000-LB. FAIRBANK DORMANT SCALE.

WOOD TANK, 8x8x3 FT.; IRON TANK, 6x6 FT.

1000 IRON PIPE FITTINGS AND VALVES.

40 000 FT. WROUGHT IRON PIPE.

SMALL TOOLS, ASSAY MATERIAL, SAM-

PLING MATERIAL, INCLUDING NO. 2

MILL, OILS, GREASE, CEMENT, Etc., Etc.

The mills contain about 200,000 feet of LUMBER.

They will be sold as they stand, or f. o. b. cars.

They have got to be taken down.

We have other Mills: Concentrating, Stamp,

Cyanide, Reduction Works, etc., etc.

ADDRESS CORRESPONDENCE TO

THE S. H. SUPPLY CO.,

22d and Larimer Streets,

DENVER, COLORADO.

FOR

SALE.

Six FIVE FOOT Huntington Mills

TOGETHER WITH NECESSARY

CRUSHING AND POWER PLANT.

Will Be Sold as Separate Items or Entire Mill.

PRESENT LOCATION: NEAR DEADWOOD, SOUTH DAKOTA.

Used Less Than Three Months. Guaranteed in Splendid Condition.

WILL NAME PRICES F. O. B. DEADWOOD, CHICAGO, OR DELIVERED AS DESIRED.

SPECIFICATIONS (Condensed).

- 6 ORE GATES, 24 x 38, rack, hand wheel, frames, bolts, complete.
- 2 ORE BINS, all necessary bolts, rods, nuts and washers.
- 2 GRIZZLEYS, 4' x 10', 1" openings.
- 6 CHALLENGE AUTOMATIC ORE FEEDERS, including hoppers, wood frame, shafts and pulleys.
- 6 HUNTINGTON CENTRIFUGAL ROLLER MILLS, 5' diameter, all fixtures and fittings, complete with wooden frame, shafts, pulleys and gearing.
- 6 COPPER TABLES, 6' x 12', 1/2" copper, electroplated 1 oz. of silver per square foot.
- 2 AMALGAM SAFES.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for main belt.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for crusher.
- 1 CORLISS ENGINE, built by Fraser & Chalmers, cylinder 20" diameter by 48" stroke, complete in every particular, shaft 10" in diameter, band flywheel 16' diameter, 30" face; weight, 42,000 pounds.
- 3 HORIZONTAL TUBULAR BOILERS, 54" diameter, 16' long, complete with steam drums 30" x 72", mud drums 18" x 66" for each boiler, breechings, smoke box, stack 48" diameter 60' long, all necessary guy rope, half arch fronts, grate bars, cast and wrought iron parts necessary for setting, feed, blow off check and safety valves, gauges and all fittings. Weight, 51,000 lbs. At present these boilers are arranged for setting in one battery. We will make any changes required, furnishing stacks and other items necessary to set each boiler separately.
- 1 HEATER, tubular, 30" diameter, complete, with exhaust pipe.
- 2 NO. 5 KNOWLES BOILER FEED PUMPS.
- 1 BERRYMAN HEATER, 18" diameter by 7' long, copper tubes, 4" pipe inlet and outlet.
- 1 HOOKER VERTICAL SINKING PUMP, 14x8x14, 6" suction 5" discharge.
- 8 ORE CARS, one ton capacity each.
- 1 WATER WHEEL, 50 H. P.
- 1 16" BULLION FURNACE, complete, including 10" Gold Retort, stack and all iron work.
- 1 NO. 5 STYLE B GATES FINE CRUSHER.
- 1 LOT REPAIR PARTS FOR HUNTINGTON MILLS, including roller shells, ring dies, scraper bars, shoes, screens, clamping plates, all new, never used.
- 1 LARGE LOT OF PIPE AND FITTINGS.
- 1 LOT BOLTS, WASHERS, RIVETS AND NUTS.
- 1 LOT OF MISCELLANEOUS SHAFING, PULLEYS, PILLOW BLOCKS, HANGERS, ETC.
- 120' RUBBER BELTING, 28", 6-ply.
- 58' RUBBER BELTING, 18", 4-ply.
- 150' RUBBER BELTING, 16", 4-ply.
- 70' RUBBER BELTING, 14", 4-ply.
- 2 LOCOMOTIVES, 20" gauge, built by H. K. Porter Co., Pittsburgh, one 6x10 cylinders, the other 8x14 cylinders, both saddle tank.

**SOLAR
HOUSE
LIGHTS**

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs **\$4.00** Per Light

EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Exceeds any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—lets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.

Write us for particulars.

“THE DANIEL BEST” 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,
16 TONS EACH,
or a total capacity of train,
48 TONS.

CAPACITY
OF
ENGINE,
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.
Estimates made for complete Steam Freighting Outfits. Address

Wm. Hoskins & Co.,
81 So. Clark Street, CHICAGO.

100 POUNDS OF ORE SAMPLED IN 10 MINUTES.

Calkins' Umpire Ore Sampler.

An accurate, quick and absolutely impartial machine for sampling ore in quantities of from

one to one hundred pounds. Easily operated and cleaned. No danger of salting subsequent samples. Makes the operation of sampling an easy one; and all competent assayers know that to obtain an assay sample by hand requires more trouble and time than is necessary to reduce the resultant sample to the pulp. Diagonally opposite portions are taken each time; and assay samples are obtained with this machine in less time and with less trouble than by any other method.

The only table made that will take the place of jigs and do away with costly and complicated machinery.

Especially designed for separating zinc from lead.

Solid Iron Tops, planed to a true surface.

All parts are interchangeable.

Wearing parts reduced to a minimum.

Capacity from 15 to 45 tons in 24 hours, according to class of ore.

Our illustrated catalogue contains all the latest information on the concentration of ores. Mailed on application.

THE COLORADO IRON WORKS CO.,

Established 1860.

DENVER, COLO., U. S. A.

Two Large Locomotives.

It is a noticeable feature in the industrial development of all countries that it is the mining industry that brings out the best and greatest in every department of mechanical activity. Whatever the kind of applied power needed, it is the work of the mine that calls out the highest skill and finest product of the "men who make things." As in other instances this is the case with locomotives. Till quite recently the largest locomotive was that on the road of the Union Railroad Co., of Pittsburg, Pa., a 23x32-inch freight hauling monster used in mine work; that is, the carrying of mine products. An illustration of it appears herewith. Its gauge is 4 feet 8½ inches, cylinders 23 inches diameter with 32-inch stroke; drivers, 54 inches diameter, outside stroke; driving wheel base, 15 feet 7 inches; total wheel base, 24 feet; weight of engine, 208,000 pounds; boiler, 80 inches diameter; tank capacity, water, 5000 gallons; coal, 10 tons.

On the upper right hand corner of the opposite page, however, is portrayed an even larger and more powerful locomotive, just put on the B. A. & P. road, Montana, to haul ore to the smelters. A comparison between "No. 95," of Pittsburg, Pa., and "No. 19," of Anaconda, Montana, is interesting. Some of the dimensions of the Pennsylvania locomotive have been given above. Corresponding figures for the Montana freight hauler show that its gauge is 4 feet 8½ inches; cylinders 34 inches diameter with 32-inch stroke; drivers, 56 inches diameter, outside stroke; driving wheel base, 15 feet 9 inches; total wheel base, 26 feet 9 inches; weight of engine, 220,000 pounds; boiler, 84 inches diameter; tank capacity, water 5500 gallons; coal, 10 tons. It will be seen that the Montana engine is much larger in nearly every way. In the latter the

boiler is of steel 1 inch thick, with a working pressure of 210 pounds to the square inch. Ordinarily boiler sheets are from ½ to ¾ inch. "No. 19" is believed to be the largest machine of the kind in the world. It hauls sixty cars—4000 tons—at a speed of 30 miles per hour, and affords another instance of the gigantic means employed in modern mining.

The engraving of the Pittsburg locomotive was secured from the Smoky City. For the photograph from which the engraving of the Montana big freighter was engraved, we are indebted to the courtesy of Mr. M. Donahue, General Manager B. A. & P. Railway, Anaconda, Montana.

The Anxiety of Mr. Morgan of Kansas.

The following series of inquiries from H. N. Morgan of Harper, Kan., appear in a Washington paper: "I have got 500 sheers of stox in the New Ofir Gold mining co. which has got goald mines somewhere out thair in Wash. terrytory. The stox says it has an ofis in Spoakin. Their agent come thrugh this county 2 years ago and me an' my nabors took a lot of it. He sed the co. had enuff goald in sight to pay the nashunal det. What we want to no is what the co. is doing with its goald? Why don't we get our sheer? When will the next distrybushun be, and will it be saife to send our sheer by freight? Is thair much danger of rode agints out thair? The agint told us we could jine in the election of ofissers. When will it be? Do you think me or my nabors could git one of the ofisses? I never done no mining, but hav a good deal of expeeryence digging wells and cellars. This is a dry country and I dug 1 well a hunderd and 27 feat depe. Do they go deper than that for goald? Please write the anser right away as we are gittin anxious. Times are hard, and if we cud get our sheer of the goald, it would make menny onest harts happy."

From the Frozen North.

TO THE EDITOR:—The sun rises about 10:30 A. M. and sets a little after 1 P. M. The thermometer hovers around zero. The wily stampeder has just struck it rich just over the divide, and all he wants to put you in a location that will make you rich in a minute is a dog team and a little grub. There is no time nor place you don't see the stampeder and his dog team rushing here and there in every direction. He is always ready to go, no matter how cold or what obstacles he has to surmount. He can crawl out of a snow bank as quickly as an Esquimau dog, hitch up and go. There are so many reported strikes one hardly knows where to go first. But there have been some good strikes made during the past two months, which ought to prove good when developed. A few have gone to the reported strike on the Cosquaquim, a tributary of the Yukon, about 600 miles from Nome. But the most promising strikes are reported in this district and the Koogeroooks, and in the Arctic district, north of here, that country sloping toward the Arctic ocean. I met some men just from that section who report fair discoveries, but there is not a particle of fuel of any kind and the ground remains frozen the year round. It is a hard country to live in, and unless one strikes it enormously rich he cannot make it pay.

There is some activity in prospecting the various benches and tundra about Nome, and I look for some good results next season in that direction.

Please save me the back numbers of the MINING AND SCIENTIFIC PRESS, that I may post myself as to what is being done in the mining world during the winter, and send them up on the first boat to P. O. box 166, Nome.

Port Clarence, Alaska, Dec. 1.

P. S.—Am anxious to know who was elected President.

LARGEST EASTERN FREIGHT LOCOMOTIVE

MINING AND SCIENTIFIC PRESS

LARGEST FREIGHT LOCOMOTIVE IN THE WEST: USED IN MONTANA MINING OPERATIONS.

In Western Idaho.

TO THE EDITOR:—In Washington county, in the Seven Devils mining district, there is a deal whereby the Blue Jacket mine will operate again with a force of sixty men. The Blue Jacket has been one of the strong shippers of the district. Last year it turned out \$40,000 in copper. The Boston & Seven Devils Copper Co. are working thirty men on the Helena mine. They shipped in February ten cars 40% copper ore. The same company have ten men sorting and shipping ore from the Decorah mine. On the Old Peacock they are working a diamond drill with promising results.

The P. I. & N. R. R. is now at Council, and this will greatly help the shipment of copper ore, leaving only 40 miles wagon freight.

Decorah, Idaho, March 9.

Close Figuring.

A shipment made last week by the Ponsardin will illustrate the necessity of shippers being familiar with the schedule of prices. The shipment was seventy-five tons, carrying, according to the samples, lead 5%, silver $2\frac{1}{2}$ ounces, iron 54%, and silica 7%. The silver contents were worth \$1.50, the lead \$1.75, and the iron, minus the silica, \$7. This was pay ore all right, but the smelter returns gave them but \$1.76 per ton for it. The difference came by the smelter finding the lead to be a fraction less than 5%, and the silica 1% greater. The lead running a half of 1% lower than they had calculated, cost them on the little

shipment \$130, and rendered the further shipment impossible, which would otherwise pay them well.—Leadville, Colo., Chronicle.

In Siskiyou County, California.

TO THE EDITOR:—During November and December the mill of the Yreka M. & M. Co. crushed 1500 tons of ore that ran from \$12 to \$15 per ton in free gold. The sulphurets, of which the ore carries about 3%, run about \$160 per ton. The mill was shut down during January and up to Feb. 14th, on account of the unprecedented cold weather and deep snow. Twenty stamps are now running on good ore, and the company expect no more shut-downs until the water gives out. The company expect to crush 6500 tons of ore by July 1st. The Mountain Laurel is now supplying all the ore for the mill. The Ohio mine is deeply blocked with snow.

The air compressor, bought of the Know Nothing mine, is at the Mountain Laurel. The air hoist and pump give satisfaction. The main shaft in the foot-wall is 60 feet below the lower level; sinking will continue indefinitely. The vein in the shaft is 5 to 7 feet wide and shows free gold and sulphurets. The ore will carry about 5% sulphurets.

The ore in the B Tunnel, Mountain Laurel mine, contains coarse gold. The company expect to install electric, canvas and cyanide plants next season. L. D. Ball is superintendent, J. W. Pierpoint mill foreman, David Jones mine foreman.

There is activity in placer mining in the vicinity of Sawyer's Bar, as there is plenty of water.

Rollin, Cal., March 6.

Golden Zone Mine, Washington.

TO THE EDITOR:—At the Golden Zone mine the two new Huntington mills are running from forty-five to sixty tons per day. The concentration varies from fifty to thirty to one, depending upon what sections of the mine the ore comes from. The drift in the fourth level crosscut two ledges, one of heavily mineralized quartz varying from 8 inches to 12 inches. The other ledge was 20 feet wide, but of low grade. All of this is being put through the mills.

THE GRIFFIN THREE ROLLER ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

London, E. C., England.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1½ to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

No. 643 BUTTON BALANCE, 10-inch beam. Sensitive to
1-100 Milligramme. This is a double-column button bal-
ance with all latest improvements, including our new ad-
justing device and rider rod lock. It is accurate and as
rapid as a beam of this length can be. For an office doing
a moderate amount of work, it is the best balance to be
had for both gold and silver. For complete description and
prices of this and other balances send for catalogue A to
Wm. Ainsworth & Sons,

Manufactured by the Roessler & Hasslacher Chemical Co.,
New York, for sale in quantities to suit by

HAAS, BARUCH & CO.,

100 CALIFORNIA ST., SAN FRANCISCO, CAL.
SOLE AGENTS.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance successful handling of ores containing copper and silver—should satisfy the more exacting inquirer. We make a specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade prop. sitions in the West owe their success entirely to these processes: our experts, however, are constantly devising improvements, the latest being a method of over coming the difficulties which have hitherto prevented the successful handling of ores containing copper and silver. Method for the profitable handling of silver ores by cyanide.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says: "It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cid., N. C., says: "Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says: "Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

DOUBLE CYLINDER SINGLE DRUM HOISTS.

The above form of Hoisting Engine has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes which assures quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

Lane Slow Speed
Roller Mill.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & Co., Patent Agents, 330 Market St., San Francisco, Cal.

30 to 40 SPEAR ST., SAN FRANCISCO, CAL.

— MANUFACTURERS OF —

All Kinds of TANKS and VATS.

Our Patent Self-Tightening Hoop Coupling is the Only Practical Method of Keeping a
Tank Tight at All Times Without Any Care or Trouble.

SMOOTH-ON IRON CEMENTS

For stopping leaks and pitting in MARINE BOILERS, for boiler patching, for repairing leaks or
fractures in steam or hydraulic work, and for repairing blemishes in iron or steel castings. These
cements are prepared in powdered form and applied by mixing with water. When hard they will
withstand a red heat, steam, water, or oil, and expand and contract the same as iron. Write for illus-
trated catalogue and prices. When ordering state for what use.

Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MESSRS. MADISON, BRUCE & SELLERS,

34-36 STEUART ST., SAN FRANCISCO, CAL. AGENTS FOR THE PACIFIC COAST.

POWELL'S GREASE CUPS.

Large Variety. For Every Requirement.

FEE adjustable the entire length of Cup.

CUT-OFF in base regulates the flow.

Any Supply House on the Pacific coast can fur-
nish them.

THE WM. POWELL CO., CINCINNATI, O.

BEST CONVEYOR FOR
FEEDING ORE CRUSHERS.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested
by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent Ameri-
can engine builders, who are good judges of lubricators. Many of these
have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use,
or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our
new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

THE BRETHERTON HOT BLAST.

APPARATUS FOR PYRITIC SMELTING. It saves fuel, increases capacity of furnace, im-
proves character of work, does not require a hot top causing volatilization like other inventions, fur-
nishes pure air heated without cost, can be attached to furnaces already in use, is an all around money
saver, built and used by practical, successful metallurgists. Write for particulars to

THE BRETHERTON HOT BLAST SMELTING COMPANY, Mining Exchange Building, Denver, Colo.

IT IS TO GRIND

THE SMITH BALLMILL

COPENHAGEN,
Vestergade 29K.

LET US ESTIMATE

on plan or equipment for your new grinding plant, or on changes or additions to your present outfit. Our grinding and pulverizing machinery is the Standard of America for reducing or pulverizing ore, cement-rock, and refractory substances generally. We are always ready to prepare estimates, submit plans or demonstrate the superiority of

Smith Ballmills and Davidsen Patent Tubemills.

By way of introduction let us send Catalogs.

ASSESSMENT NOTICES.

ALLIANCE EXPLORATION & MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of February, 1901, an assessment (No. 3) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 236 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of April, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of February, 1901, an assessment (No. 2) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 4th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SPANISH CONS. QUARTZ MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of February, 1901, an assessment (No. 4) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of April, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

B. N. SHOEGRAFT, Secretary.

Office—113 Crocker Building, San Francisco, California.

HERCULES stands for the best,
for the most improved — Gasoline Engine.
Special attention given to hoists and mill engines
for mines. 2½ to 400 H. P. New catalogue
Jan. 1st.

HERCULES GAS ENGINE WORKS,
141-143 First St., San Francisco, Cal.

POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.

PRACTICAL ROOFING==

For more than 14 years P. & B. Ready Roofing has been practically tested and found unequalled as a roof protection from the multitude of climatic conditions present in the frozen regions of the north and torrid countries of the south and in those places situated between. It is used in the largest and best buildings constructed in this country. It outlasts, outwears and gives better satisfaction than iron, because it does not expand with heat or cold and leak at joints—than tin, because it does not sweat and rust out—than shingles, because it does not warp and curl—than slate, because it does not become brittle and flake off—better than all other roofings, because it is made better and made to last longer. Anyone can apply it without technical knowledge or skill—comes in rolls and is easily and cheaply transported. Send for booklet. Address Dept. A.

Tin Mining in the United States.

Constant increases in the manifold uses of tin and scarcity of tin deposits on this continent lend interest to possibility of tin production anywhere in the United States. Last year this country imported 71,000,000 pounds tin, valued at \$16,000,000. At times discoveries of tin have been reported in various sections throughout this west half of America, but scientific investigation showed no proof, or else mismanagement or misrepresentation prevented development.

In the States of California and South Dakota it has been shown that tin ore in paying quantities exists. The tin deposits at Temescal, in the southern part of California, have heretofore received considerable attention in this journal. These tin deposits lie in the center of a semi-circular area of granite 2 miles in diameter in the northwestern portion of the San Jacinto grant, 5 miles southeast of South Riverside, Cal. The sedimentary rocks along the edge of the granite area are quartzite mica schist and conglomerate. The granite is distinctly intrusive; it consists of plagioclase, orthoclase and quartz in equal proportions, with a less amount of biotite mica. The semi-circular area of granite and portions of the adjoining porphyry are fissured in a northeast and southwest direction along innumerable lines and a black vein matter deposited. These veins vary from $\frac{1}{4}$ inch to 3 inches in thickness, except in the case of the main tin-bearing vein at Cajalco hill, which is in places 20 feet wide; 400 feet northeast of Cajalco hill the vein narrows to 6 feet. At that point a large body of tin ore was discovered and the main shaft sunk. The vein here consists of equal parts of tourmaline and quartz, the bunches of tin appearing to have been formed by replacement. Workings to the depth of 180 feet exposed the vein 8 feet wide, and, horizontally, 300 feet, the tin oxide distributed either through the vein matter or in stringers and bunches. The average of the ore milled was about 5% oxide. Analyses of ore therefrom quoted by Genth, Blake and Hanks showed silicic acid, 9.82%; tungstic acid,

Cambria, Wyoming, Whence Comes Most of the Coal Used in Refining Black Hills Ores.

.22%; oxide of tin, 76.15%; oxide of copper, .27%; oxides of iron, manganese, lime and alumina, 13.54%—an exceptionally pure specimen.

The Temescal tin ore occurs in two forms, the more important and common variety either massive and of a brownish color, or in clear reddish-brown crystals lining cavities; the less common variety is that of "wood tin," which appears uncrystallized and in the form of thin layers. Nothing material has been done at the Temescal tin mines for ten years.

It has also been some considerable time since any activity in developing the tin deposits of South Dakota, since the culmination of the misapplied ef-

forts in the case of the Harney Peak Tin Co., in the Harney Peak tin range, in Pennington and Custer counties. With American and English capital, in equal proportions, the Harney Peak Tin Co. erected mammoth mills (a view of these at Hill City appears herewith) with unsatisfactory results, and amid general crimination and recrimination the project fell through. The company was organized in New York City about ten years ago, and in one way and another nearly \$2,000,000 were spent. The greater part of this money came from England, but passed through the hands of New York promoters. Several carloads of ore were sent to England which carried 20% black tin, and there was no difficulty in getting money for investment; but nothing tangible was ever done at the mine, except to show that, properly managed, the property could be made to pay, till finally disagreements between stockholders and directors on both sides of the ocean resulted in closing everything and the appointment of a receiver. It is now stated that the stockholders of that company are moving in the matter of reorganization and resumption of work on their holdings.

This year gives promise of active development of the tin mines of the Black Hills. The Niagara Tin Smelting Co. of New York, capitalized at \$1,000,000, has organized and claims to own eighty acres of tin deposits in Bear Gulch, 7 miles from Iron creek, on the B. & M. Railroad. Bear Gulch produces tin of a different nature to that noted in Temescal, Cal.—a stream tin, or cassiterite; a shipment of several tons of Bear Gulch tin ore sent to Cornwall, England, in 1900, gave an average of 24% metallic tin. It is the stated intention of the Niagara Tin Smelting Co. to build a concentrating plant in Bear Gulch with a daily capacity of 150 tons ore, to produce eight tons high-grade concentrates for shipment to the electric smelting works at Niagara Falls, N. Y.

Worked on a large scale, intelligently and in compliance with modern mining methods, there should be resultant profits in the proposed tin development of that section.

Harney Peak Tin Mining Company's Plant, Hill City, South Dakota.

INDICATIVE of what the California oil production means to the mining and manufacturing industries of the Pacific coast is the action of some of the largest fuel consumers in Arizona, which are arranging to substitute oil for coal.

THE United States Geological Survey has undertaken the collection of statistics of the annual production of gold and silver from the mines of the United States, and will place the work in charge of one representative in each producing State and Territory.

CRIPPLE CREEK, COLO., till recently had no mine shaft over 1200 feet in depth. That the ore "goes down," as elsewhere, is being daily demonstrated, and, as elsewhere, deep mining is now projected, in several instances to a depth of 3000 feet. At a point 3000 feet below the croppings of the Kennedy mine, Amador county, Cal., last week an unusually rich vein of gold ore was struck. This week the North Star ledge, in Nevada county, Cal., has been struck at a vertical depth of 1600 feet, showing that deep mining also pays in California.

RECENTLY was noted in an electrical work involving the expenditure of several hundred thousand dollars that the bids from the six competing firms were within a few dollars of each other, illustrating the exactitude of conditions, and how closely such things are figured. Last week in response to bids asked for cast iron water pipe at Los Angeles, Cal., bids were received from all parts of the country west of the Mississippi, the contract being given to a San Francisco firm at \$29.50 per short ton, a Colorado firm bidding \$30 and a St. Louis, Mo., firm \$29.75.

ANDREW CARNEGIE, who said some time ago that it was a disgrace to a man to die rich, is putting his precept into practice by princely endowments of various deserving projects, and now proposes to cap his former gifts by giving \$25,000,000 for the erection and maintenance of a technical school in Pittsburg. It is the miners who always do big things, and when a master miner like Carnegie starts a scheme of that kind he has the brains and the money to make it a success. The great good that such a school can do is so manifest that it needs no elaboration. Apart from its monumental relation to its founder, it will advance mining and scientific progress in a degree commensurate with its opportunities and help the mining industry.

Ore Concentration by Oil.

Several references have already been made herein to the Elmore ore concentration process, designed for concentration of ore, tailings and slimes by the use of oil. The process is stated to be now in operation at the Glasdir copper mines, Dolgelly, Wales. The treatment differs materially from customary forms of ore concentration, as the principle of operation does not depend upon the difference in specific gravity of the materials, but on the surface condition of the ore, and on the fact that some surfaces are attachable to oil, and others are not. In the operation at Glasdir, copper ore, after passing through a breaker, then crushed by rolls and further reduced to pass through a 30-mesh screen, is passed as wet pulp into the open end of a horizontal rotating drum, kept constantly agitated and pushed forward by a cross-bladed helix, a small quantity of petroleum residue being introduced with the pulp. According to the account furnished, "this oil sticks to and buoys up the particles of mineral that are floating about in the pulp, but it has no effect upon the particles of rock present." From the horizontal rotating drum the pulp and oil discharge into a box in which the rock residue settles and flows off with the water at the bottom, the oil carrying the ore floating to the top and flowing continuously into a machine wherein by centrifugal force the oil is extracted from the ore, ready for re-use. It is stated that the plant weekly treats 250 tons of ore, and 80% of the copper contents of the ore are recovered. Further tests with free-milling gold ores and sulphides are stated to have afforded satisfactory results, but no details are to hand. The loss of oil is stated to be from one to three gallons per ton of ore treated. The process is a decided innovation on existing concentration methods, and further details of experiment and results would be of general interest. The controllers of the Elmore process say they would like to get samples of gold-copper ores, which they will treat free of cost to mine owners and report results. Their address is 4 Bishopsgate street (Within), London E. C., England.

A NOTICEABLE FEATURE of the mining industry is the increasing number of publications entirely devoted thereto. There is probably no department of industrial life in which a greater degree of such activity is manifest. New journals have started up in all sections of the metal mining region in the last few years, some of them with sufficient reason for existence to enable continuance. Especially noticeable is the increase of mining publications on the Pacific coast, finely exemplifying the prominence of the mining industry. In California the activity in oil production has occasioned considerable accession to current mining literature, two dailies and four weeklies having been added to the number of mining publications already appearing. In Colorado also, especially in Denver, the number of mining journals is increasing. In addition, the newspapers throughout the entire west half of America devote considerable attention to metal mining, and even mining publications east of the Alleghenies are similarly influenced to give increased attention to the great basic industry of the nation.

BRITISH COLUMBIA makes a mistake in its treatment of the lode prospector. It charges him \$5 annual license fee; a \$3 poll tax; \$2.50 every time he does anything in connection with his claim; 50 cents a cord royalty for timber he uses on his claim, and if ever he gets his prospect to the productive stage he has to pay 2% royalty on all net returns. A good deal has been said about the prospector—his courage, ability, etc.—much of which is so. As a plain business proposition, it is to be noted that the prospector should not be restricted, rather encouraged. He is the mainstay of the mining industry, the pioneer in all mining, the man who makes mining possible, the best friend of the miner, the mining machinery manufacturer and the precursor of all the industries attendant upon mining. He does not ask any favors, but the region that restricts him hurts itself. It is a mossback policy to discourage the prospector, as it tends to keep capital out of a mining country. Several mining sections found this out long ago.

GEORGETOWN, COLORADO, business and mining men have commendably adopted a good way in which to advertise the mines of that section. They have incorporated, raised some money and are using the columns of the local paper, the Courier, to weekly present truthful statement of the showing and output of the mines in that part of Clear Creek county. This is in line with what has often been suggested in these columns and is of practical value. There are so many reasons why such work is good, and they are so manifest that it should be unnecessary to present them. Of course, it may be said that no amount of advertising will put one dollar's worth of ore in the ground, but it will help take out many a dollar's worth of ore that otherwise would remain there and would liven up many a mining camp. The Georgetown people are merely putting into execution a realization of the idea that this is the day of advertising, and that anything worth advertising should have it. It would be well if other sections followed the example of the Georgetown people; there is no other one element of more value to local mining industries than the home paper published right where the mines are being developed. Every line of truthful statement so published is of value to every resident; it attracts attention, some of it is republished in prominent mining journals throughout the country, and the district and its claims to notice are thus brought to the attention of mining men and investors. Too little credit is given the local papers published in mining towns of this west half of America for their oftentimes unaided and unappreciated efforts in bringing to notice the mines of their localities, and it would be money well spent for the enterprising business men and mine owners of every town supporting a paper to do what has been done in Georgetown.

THE technical press of the country has long urged the adoption of a national bureau of standards, and in accordance therewith Congress has passed a bill establishing such a bureau and appropriated \$100,000 toward the erection of a suitable building at Washington, D. C., the entire cost of which is not to exceed \$250,000. It is of direct benefit to the electrical manufacturing industry of the country. In connection with this whole subject of standardizing comes more frequently the suggestion from various quarters that the time has arrived when concerted private effort is requisite to create some system of standardization in the matter of mining machinery manufacture. The idea is not deemed practicable. It is one thing to secure electrical standards, and quite another to attempt any standardizing of any kind of machinery, electrical or otherwise. To "standardize" mining machinery would be an impossible effort, and even if possible would be unsatisfactory, tending to repress advance and improvement. The best thing that can be done in that direction is systematic economy in factory processes. In pumps and boilers effort has been made to create and maintain standard specifications, with some degree of success, but, in general, the demand for individuality and progress will constantly work against the adoption of standards for machinery.

A LOCATION of a placer claim upon public surveyed lands must conform to legal subdivisions; otherwise such location is invalid and the claim is subject to relocation by the first comer. Where placer claims are upon surveyed lands and conform to legal subdivisions, no further survey or plat is required. Where placer claims can not conform to legal subdivisions, survey and plat should be made as on unsurveyed land. In the case where a placer claim can not be conformed to legal subdivisions, the burden of the proof that they can not be so conformed rests entirely upon the locator, and can only be proven in cases where, before the public survey was made, certain mineral or agricultural claims were laid, or where an unnavigable stream intervenes, the gravel bed of which is mineral bearing, and claims usually called river claims are located thereon. In such cases, and only in such cases, can a placer claim on public surveyed lands depart from legal subdivisions. In all such cases the law admits of survey and plat as on unsurveyed lands. These being the only exceptions under the law, it is for the locator to prove that such conditions exist as to make it necessary to depart from a location by legal subdivisions.

Concentrates.

PYRITIC gold ore can be treated by chlorination at a cost of \$5 per ton.

THE following alloy will not oxidize: 120 parts brass, 60, nickel; 8, platinum.

THE average percentage of silver in California gold ore varies from 5% to 20%.

BUTTE, MONT., consumes about 250,000 pounds dynamite monthly, mostly 60% powder.

THE Idaho Legislature has appropriated \$5000 for the mining congress to be held in Boise in July.

CALIFORNIA freight engine fuel tests show that four barrels oil equal 2240 pounds Nanaimo coal.

A 3-INCH NOZZLE under an effective head of 100 feet would discharge 3.14 cubic feet water per second.

CALIFORNIA-MADE DYNAMITE can be put at a profit afloat in South African ports at 17 cents per pound.

THERE are 880 stamps on Douglas Island, Alaska, and their combined annual capacity is about 900,000 tons.

P. & B. PAINT is a good coating for iron pipe. Asphalt lacquer, thin, is also good; if the latter is wanted gray, add zinc oxide; if brown, red lead.

MERCURY CHLORIDE is found in minute quantity at the Terlingua quicksilver mines, Terlingua, Texas, occurring as a white bloom on some of the ore.

THE United States Government offers no "bonus" for the discovery of tin. The latest regarding development of U. S. tin deposits is on page 143 of this issue.

THE specific gravity of osmium is 22.447; gold, 19.265; lead, 11.369; iron, 7.79; lithium, 0.594. Besides being the heaviest, osmium is the most infusible of metals.

TO HARDEN copper by any other treatment than hammering does not seem practicable, though alloys of copper can be made much harder than the metal itself.

UTAH supplies about 50% of the pumice stone in domestic use, the product being prepared in Chicago. There is a duty on the imported article of \$6 per ton.

TO SOFTEN hardened or chilled cast iron, heat the piece red, then drop a bit of brimstone the size of a pea where the hole is to be drilled; let the iron cool slowly.

THE latest authentic information regarding Siberian mine exploitation can best be secured from the Russian Consul, V. A. Artsimovitch, Safe Deposit Building, San Francisco.

By melting together 100 parts silver, 3.5 parts iron and $\frac{1}{2}$ part nickel a compound is obtained which, by cooling in cold water, becomes hard as glass, and in hot water hard as spring steel.

THE U. S. standard gallon contains 231 cubic inches. This amount of water at 60° F. weighs 8 $\frac{1}{8}$ pounds. Raw lined oil, with specific gravity 932, should, therefore, weigh 7.766 pounds to the gallon.

A "STELLA" is a \$4-gold piece coined at the Philadelphia mint in 1876. It contains 6 grains gold, 1000 fine, 7 parts copper, 3 parts silver. About 500 were coined, and they are worth about \$5 each.

THE total shipments of Lake Superior iron ores during the year 1900 amounted to 19,121,393 gross tons. The largest producing mine in that region last year was the Fayal, in Minnesota, 1,252,504 tons.

THE Standard Electric Co. of California line distance from the Blue Lakes plant on the Mokelumne river to Stockton is 43 $\frac{1}{2}$ miles; the aluminum wire used is 294 mils diameter and weighs 419.4 pounds per mile.

DENSE SMOKE per ton of fuel emits from ten to twelve pounds soot. Of this one-half is carbon, the remainder 40% unconsumed hydrocarbons, 8% ash, 2% moisture. No smoke is produced in an atmosphere of oxygen.

AS TO WHAT shall constitute a proper marking of a mining location, it may be said that in the absence of Federal, State or local regulations it would be safe to put a monument on every corner, and two more on the vein.

CONVERTERS used on copper matte vary in size, from 5 feet diameter, 9 feet high, in Montana to 8 feet diameter, 16 feet high, in Mexico. Smaller converters are preferred by smelter men as securing better economy of operation.

SHAFT No. 5 of the Tamarack, Mich., Copper Co. is the deepest mine shaft in the world. The shaft was begun Aug. 7, 1895, and on Dec. 20, 1900, cut the lode at a vertical depth of 4662 feet; on Jan. 1st, 1901, the shaft was 4680 feet deep and had cost \$663,508.

FOR the common, ordinary, rough-and-ready prospector's assay the California gold pan is about as good as any device, affording opportunity for fairly approximate estimate of the value per ton of gravel or crushed rock, in the hands of an experienced operator.

UNTIL patented, the title to a mining claim vests in the United States, and, hence, the claim is not, in law, subject to State or county taxation. The claim of the county assessor is that he doesn't tax "the mine," but "only the locator's possessory right therein."

THE bromine test—macerating the powdered coal in bromine water—affords the most convenient, rapid and accurate means of determining the tendency of coal to spontaneous combustion, but must be done by or under direction of a competent chemist or analyst.

THE most authentic news procurable is weekly pub-

lished concerning mining districts and the mines therein, but it is not practicable to give advice or opinion as to the merit or future of special mines or prospects. But where fraud or trickery is manifest, the fact is promptly noted.

NON-EXPLOSIVE POWDER, which does not explode but burns slowly with a hissing noise, contains three parts potassium nitrate to one part of sodium nitrate. The powder is mixed in the following proportions: 56.22% potassium nitrate, 18.38% sodium nitrate, 9.7% sulphur, 15.7% charcoal.

THE aerial wire rope system of transportation has in many isolated cases satisfactorily solved that problem and made profitable the milling of low-grade ores. In the one county of San Juan, Colo., there are 72,470 feet of such line now in successful operation, and about 15,000 feet more is projected this year.

IN the Provo-Mercur, Utah, electrical transmission 40,000 volts are used. The highest California transmission voltage at present is 33,000 over an 82-mile line to Los Angeles, though, as stated editorially in last week's issue, the Blue Lakes Co. propose ultimate transmission of 50,000 volts, 140 miles to San Francisco.

THE composition of air is 79 volumes nitrogen to 21 volumes oxygen, so that the air required to furnish oxygen for the complete combustion of coal gas in a gas engine is $215 \times \frac{1}{4} = 8.1$; 1 cubic foot gas requiring 8.1 cubic feet air. In the ordinary gas engine about 20% of the total cylinder volume of products of combustion are retained.

It is true that the cessation of silver mining has lessened the demand in that line for quicksilver, but mechanical and chemical arts have become great absorbers of that metal and the general demand does not diminish, while there is a steady yield of quicksilver from California and new territory promises to supply any diminution from the older properties.

THE Rand, South Africa, mines may be resuscitated by July 1st. The gold output for the first nine months of 1899 was £14,707,906; on that basis the uninterrupted output of that entire year would have been £19,500,000. The loss sustained by the Transvaal gold mining companies may not exceed, directly, \$40,000,000, but the indirect losses and damages to be recouped therefrom by the Government will probably aggregate considerable.

THE weight of water in a pipe may be approximately estimated as follows: Square the diameter in inches and the result will be weight of water in pounds for each yard of pipe. This rule is also, of course, applicable to circular tanks, if vertical. For instance, the weight of water in a circular vertical cistern 10 feet diameter with 8 feet, or 2 $\frac{2}{3}$ yards water in it, will be $120^2 \times 2\frac{2}{3} = 38,400$ pounds, which result is about 5% less than the actual weight of water at 60° F., but 3% more than the weight at 212°.

THE voice one hears over the telephone is not the voice of the person who is talking; it seems exactly like the real tones, drawn out thin and small and carried from a long distance by some mechanical means, but it isn't. When one speaks into the instrument a little diaphragm like a drum head begins to vibrate and each vibration sends a wave of electricity over the wire. These waves set up a mimic vibration in another diaphragm at the opposite end which jars the air and produces an imitation of the original voice. The result seems like the real thing, but is merely a first-class counterfeit.

THE gasoline engine is essentially the same as the gas engine, the main difference being that the former uses liquid fuel which is turned into gas just before being drawn into the cylinder. The consumption of fuel in a gasoline hoisting engine is in proportion to the number of foot pounds lifted in a given time, basing the calculation on one-tenth of a gallon of gasoline to each horse power exerted per hour. Using the tank system for water circulation around water jacket and valve chambers on a continuous 40 H. P. load, the evaporation of water would be about twenty-two gallons per twenty-four hours.

THE warning complained of by "Silex" in a Washington paper for miners to "keep away" may be based on the best of reasons. Whenever there is a discovery, big or little, in a new mining camp many men run there, expecting something to do, and it is but kindness for a local paper to warn them away. Probably skilled miners would have no difficulty getting work there or anywhere else, but "Silex" doubtless knows that the surplus population in new mining camps has a large percentage of men who claim to be "miners," but are really only hangers-on. As a matter of fact, a man who wants to learn something about mining would do better to go to an old mining camp than a new one.

MANY gasoline engines conduct the gasoline in liquid form to the mixing valve of the engine, at which point it is atomized by the inrush of air into the cylinder on the charging stroke. The feeding of gasoline to the engine may be accomplished by gravity or by a small pump. The latter method is considered safer, as it permits the placing of the supply tank at a lower level than the engine. Galvanized pipe is considered best for the supply and return pipes connecting the engine with the tank, the joints to be soldered and made perfectly tight; if black pipe only is available joints should be packed with some substance not acted upon by the liquid. Soft soap and flake graphite, well mixed, constitute a very good packing for such purpose, and make a good lubri-

cant for the small feed pump. Pipes should be drawn up very tightly, and, if possible, tested thoroughly with air pressure before they are filled with gasoline.

THE thermo-hyperphoric process is an Australian invention, and its originator, Jos. Campbell, so far as is known, has not succeeded in making it a commercial success. Its principal feature is the passing of water-gas—a mixture of hydrogen and carbon monoxide—through the roasting ore at a temperature of 2000° F. The ore is first crushed to about a $\frac{1}{2}$ -inch mesh, then roasted in an automatic sealed furnace, and, while roasting, the water-gas is passed through it. The claim of the inventor is that "refractory" low-grade ore can be treated at a total cost of \$1.50 per ton with 90% to 95% gold extraction. The results, so far, do not seem to justify the correctness of the claim.

IN cyanide work the velocity of the percolating solution is of import. The highest rate of solvency of gold and silver is accomplished when the speed of the solvent is just sufficient to remove the film of saturated solution around the precious metal particles as fast as it forms. The superficial area of these particles has, however, much to do with the matter. The maximum velocity of solvent at which the maximum rapidity of solution can be effected is something that must be individually determined in the case of each particular ore. This velocity differs for silver and gold. Leaching at the proper velocity for the gold, and, subsequently, at a different velocity for the silver, gives the greatest percentage of total extraction.

A FILE, to do its work fast and well, should be kept free from its cuttings. Cuttings "pin" when they lodge so finely that they can not be removed with a brush. Pinning may be obviated by chalking the surface of the file, but this has the effect of reducing its bite. A little oil on the file will frequently reduce the tendency to pin. It should be used, however, only on the fibrous metals, as it glazes the surface of the non-fibrous metals, making them harder to cut. Chalk is usually applied to a file when a smooth, fine work surface is desired. The effect of the chalk is to prevent the teeth from cutting as freely as when it is not used, and thereby produces about the same result as would occur if a finer cut file had been used. When oil has been used on a file it can be readily removed by thoroughly chalking and brushing two or three times, as the chalk soaks up the oil and leaves a dry surface.

SOME bullion buyers use two crucibles in melting, the inner one of the Battersea make, the outer of black lead. This practically eliminates risk of loss by breaking. Both should be well tempered before applying a melting heat. The amalgam should be well cleaned of sulphide matter or the bar will be covered with a matte, and must be remelted and refluxed. If, after dipping the skimmer into the slag, it should be cooled in water, it must not be dipped again into the crucible until perfectly dry, or the sudden conversion of water into steam will cause an explosion sufficient to scatter bullion about and endanger the operator's eyes. Pour the melt when at a high heat, and, to get a good sample, bore it with a $\frac{1}{8}$ -inch twist drill to the depth of $\frac{1}{4}$ inch at several points. This furnishes a better sample than chipping. The crucibles and slag may be pulverized and panned, whereby there is no loss through them; but crushing the slag in an ordinary hand mortar should not be attempted, as the particles will give serious difficulty if they get into one's eyes. Also, burn the canvas or ticking in which amalgam is squeezed, and pan the ashes. One large bullion buyer does not skim his meltings, claiming by so doing to save his customers from all loss in slag. Where gold is from sulphide ores this buyer uses potassium nitrate crystals as an oxidizing agent, and borax glass as a flux; then pours without any skimming whatever. If the bar is still base the operation has to be repeated until the result is satisfactory. Careless skimming may easily take up gold.

PROBABLY the procedure at the Utica, Cal., mine may answer the Sumpter, Or., inquiry as to clean-up of copper plates. At the Utica mill the head plates—that is, the first 8 feet at the upper end of each sluice—are raw copper; the remaining 14 feet are plated with 2 $\frac{1}{2}$ ounces of silver to the square foot. The plates are cleaned every morning, two men usually working together and each taking a plate on adjoining batteries. A plug of soft wood is driven into one of the 3-inch holes in the cast iron apron, causing the pulp to run through the trough and out through the other 3-inch hole on the other plate. The plate they cut off is first washed with clean water, to remove all sand, then sprinkled with quicksilver, and then rubbed with a whisk broom, to loosen as much amalgam as possible. Every five or six days a weak solution of cyanide of potassium is used in dressing the plates. Great care is exercised in applying cyanide to amalgamated plates, for if too much is used they become hard and glassy. After the plates have been thoroughly treated with the whisk broom, they are rubbed downward with a piece of 75% pure indiarubber gum, $\frac{1}{4}$ inch thick, 4x7 inches in size. The amalgam is then taken up, together with all the sulphurets that may have adhered to the plates during the run of twenty-four hours. The plate is then lightly sprinkled with quicksilver at the head, as the case may require, and lightly brushed with the whisk broom for the full length. The last plate is always brushed upward from the extreme end, so that, in case any amalgam should be hanging to the edge of plate, it will be brushed up to where it can be readily seen and picked up.

Questions and Answers.

What is necessary to locate and hold a mill site location in connection with a quartz claim? T. G. Gazelle, Cal.

The mill site must be on unoccupied non-mineral land and may join the side lines of a quartz claim if the land on which the site is located is non-mineral. To avail one's self of the provision of law permitting the entry of mill sites, any one holding the possessory right to a vein or lode, and to a piece of non-mineral land not contiguous thereto, for mining or milling purposes, not exceeding five acres, may file in the proper land office application for a patent, under oath, with plat and field notes, to include and describe, in addition to the vein or lode, such non-contiguous mill site, and after due proceedings as to notice, etc., a patent will be issued conveying the same as one claim. The owner of a patented lode may, by an independent application, secure a mill site if good faith is manifest in its use or occupation in connection with the lode and no adverse claim exists. Where the original survey includes a lode claim and also a mill site, the lode claim should be described in the plat and field notes as "Survey No. 37, A," and the mill site as "Survey No. 37, B," or whatever may be its appropriate numerical designation; the course and distance from a corner of the mill site to the corner of the lode claim to be invariably given in such plat and field notes, and a copy of the plat notice of application for patent must be conspicuously posted upon the mill site as well as upon the vein or lode for the statutory period of sixty days. In making the entry no separate receipt or certificate need be issued for the mill site, but the whole area of both lode and mill site will be embraced in one entry, the price being \$5 for each acre and fractional part of an acre embraced by such lode and mill site claim. In case the owner of a quartz mill or reduction works is not the owner or claimant of a vein or lode, the law permits him to make application therefor in the same manner prescribed herein for mining claims, and after due notice and proceedings, in the absence of a valid adverse filing, to enter and receive a patent for his mill site at \$5 per acre. In every case there must be satisfactory proof that the land claimed as a mill site is not mineral in character, which proof may, where the matter is unquestioned, consist of the sworn statement of two or more persons capable, from acquaintance with the land, to testify understandingly.

In the case of Hartman vs. Smith, Montana, 19, the decision of the court was that: "All that is necessary to make the claim of a mill site by the owner of a non-contiguous mining claim valid, is the reasonable use and occupation thereof for mining purposes in connection with a mining claim."

I want a method to enable me to scorify a cupel without a muffle—something that will give a gold assay with less time and effort. T. D. Idaho Springs, Colo.

Eight columns, with several illustrations, were given in the issues of July 9 and 16, 1898, to that subject, being a monograph on "Scorification and Cupellation Without Muffle—a New Furnace and Method for Gold and Silver Assays," by G. A. Koenig.

The vein I am following runs out of my ground under land to which there is an agricultural patent or timber land patent, I forget which. Now, can I keep on or must I stop at the limit of my claim? S. H. Baker City, Or.

The operator of a mining claim to which he has a patent has a right to follow the dip of the vein under and through agricultural or timber land, if his is the senior title; that is, if his patent antedates the patent or possessory right of the adjoining agricultural or timber land. But if the patent or possessory right to the agricultural or timber land is of a date preceding that of the mining claim, the owner or operator of the latter has no such right.

In your issue of Feb. 16th you say that proof of the annual work upon a mining claim must be filed with the county recorder. I don't believe that. The law was repealed by the Legislature in 1897. Please correct. Redding, Cal. G. T.

The statement does not need correction, but G. T.'s assertion does. The law concerning mining locations passed in 1897 was repealed in 1899 (and re-repealed in 1900), but the law of 1891 was not repealed. That law is in force, requiring that within thirty days after the time allowed by law in which to do the annual work upon an unpatented mining claim in California shall have expired, an affidavit particularly describing the labor and improvements and value thereof must be filed in the office of the recorder of the county in which the claim is. In case of failure to do so the law says that "the claim or mine shall be open to relocation."

How are the filaments made that are in incandescent electric lights? I am told here that they are made of thread. J. D. Portland, Or.

Sometimes they are made of cotton or silk thread. Where cotton thread is used it is usually parchmented, first by dipping in dilute sulphuric acid and then washing and drying. The thread is then wound on a form of carbon or other refractory material of the same section as the finished filament is to have,

and then packed with other forms in a case with carbon dust and baked at a very high temperature. After the thread has been thoroughly carbonized it is introduced into the lamp bulb, the latter is exhausted of air and the current turned on. This is always done before the lamp is sealed off in order to get rid of occluded gases. It also usually goes through what is known as the "flashing" process, which consists in subjecting the filament at a white heat to an atmosphere of hydro-carbon gas. By this process the filament is made more uniform in conductivity by reason of the deposit of carbon upon the more highly heated and therefore thinner or weaker portions, due to the decomposition of the hydro-carbon.

In this section, when we want to swear in a witness in court, in the absence of a Bible, we swear him on a copy of the MINING AND SCIENTIFIC PRESS, and everything it says is law and gospel; but, occasionally, we see something in it that seems hard to believe. For instance, in your paper of Feb. 16th, you say, in "Concentrates": "It is possible to frame a block of such shape that it will fit either a round, square or triangular hole." Now that rather gets us, up here. We don't say it isn't so, but would like to have some explanation of the how and why of it, if so it is. R. B. Silverton, Colo.

The statement as made was in answer to a question from Chapultepec, Mexico, asking if such a block could be framed, being a two-line affirmation of the matter. The question is of easy determination, but is worth some detailed discussion. The proposition may be put as an assumption that such a block may be framed, and then will come the question: "What is the shape of the body that will fit into a round, square or triangular hole?" Let us see. It must fit any one of these three different-shaped holes. In Fig. 1 appear a circle, a square and a triangle; looking

FIG. 1.

at them from the standpoint of a mechanical draughtsman, it is evident that the body formed to fit any one or all three of these shapes must have a plan of a circle, its side view must be square and its end view

FIG. 2.

must be a triangle. Fig. 2 furnishes a perspective view of such a block so framed as to fit. Fig. 3

FIG. 3.

is designed to show that the projections of Fig. 2 are in exact accord with the requirements as shown in Fig. 1, and that such a shaped body will fill all the requirements of the problems viewed by the eyes; from above it would appear circular; from the end, triangular; from the side, square.

There appears to be undue consumption of cyanide in one or two plants in this vicinity, and suggestions as to the cause of abnormally high cyanide consumption would be in order. El Oro, Mexico.

Manifestly but little can be said, and that little only in the most general way. Individual knowledge of local conditions and the nature of the ore is needed to state anything specific. The cause of high consumption may be determined by proper analysis of the cyanide solution. Place 100 grammes of the pulp in a wide-mouthed bottle, add 200 c. c. of the cyanide solution and agitate for fifteen hours. Filter; take 20 c. c. of the filtrate (equivalent to 10 grammes of ore) and evaporate almost to dryness in a porcelain dish. Add some strong sulphuric acid, evaporate almost to dryness and cool. Dilute with water, add some hydrochloric acid, and heat to effect solution, if necessary. The metal in solution may now be determined by the usual laboratory methods. It is to be assumed that the proper preliminary treatment is given the ore. Alkaline treatment precipitates the hydrates, which are then inert toward the potassium cyanide. For every part of the cyanide rendered in-

operative a corresponding proportion of metal enters the solution. For instance, one part by weight of iron consumes seven parts by weight of potassium cyanide, etc.

Where and how can I get the publications of the State Mining Bureau? I am unable to get them from the Bureau itself, that ought to have them on hand. Quincy, Cal. J. J. R.

Some of the publications are out of print, the supply having been exhausted. If you write to the State Mineralogist, San Francisco, specifying precisely which ones you want, you will get them, if on hand, and, if not, will be so notified. There has been no money available for printing for the California State Mining Bureau for four years, but the last Legislature appropriated \$7000 for printing and \$3000 for reissue of certain publications that were speedily exhausted when first issued.

What did the last California Legislature do with the office of State Debris Commissioner? R. O. Grass Valley, Cal.

Continued it and cut the annual salary from \$3650 to \$600.

Kindly tell me through your paper what demand there is for empty mercury flasks, made of iron, weighing about fourteen pounds, being about 4 inches diameter and 12 inches high, not including the neck that is fitted with a screw plug? What are they worth per thousand? How and where can I sell a large number of them? What would they cost delivered at San Francisco, and what could I get for them there? Where are they made and bought, how carried, and what is their first cost? A. J. L. Central City, South Dakota.

This question has been the subject of considerable inquiry in an attempt to answer it. Five letters were written. The answers received are condensed below. Probably they give as complete reply to the question as can be had:

No. 1. I have never paid any attention as to what becomes of the empty quicksilver flasks, but here they are mostly thrown on the dump or iron scrap pile. In a few instances they may be returned to the company from whom they were purchased. In many instances they are thrown in a pile and never thought of again. Nobody here wants them.

No. 2. Empty flasks are not returnable by the purchasers of quicksilver. All the quicksilver mining companies in California purchase only second hand flasks, which are imported from China and cost, f. o. b. San Francisco, 25 cents each.

No. 3. All quicksilver flasks used on this coast for the past twenty years are "second hand," having been refilled many times. We obtain the larger portion from New York and China, where they are picked up by dealers. A small quantity comes from the mining sections. They are laid down in San Francisco for 25 cents to 30 cents, depending upon freight rates. Before being refilled they are tested for leakage and carefully cleansed. They are made of wrought iron.

No. 4. Our quicksilver mines have for years been supplied with old flasks, coming mostly from China. These flasks were delivered to us in San Francisco at from 25 cents to 28 cents each. They were required to be in good condition and have stoppers. The Chinese store their empty flasks for the purpose of sale, while in this country the flasks, as a rule, are tossed out on the dump and exposed to the weather, so that in a very short time they become unfit for use again. We had not purchased any new flasks from 1887 to 1898. Those new ones came from Pittsburgh and were made from wrought iron tubes, the top and bottom being welded on. They cost new at that time, with stoppers, \$1.25 each. If your South Dakota correspondent will communicate with any of the larger quicksilver mining companies, agreeing to deliver at San Francisco his flasks in good condition, with stoppers, he might be able to negotiate a sale.

No. 5. If the South Dakota man has several thousand empties, he would temporarily overstock the local market. If his flasks are usable—that is, in good condition and supplied with stoppers—he might get say 20 cents each for them. The freight on them from Deadwood to San Francisco in ton lots would be \$2.80 per 100 pounds, or 35 cents each laid down, probably less in carload lots.

Could an inexhaustible supply of limestone carrying an average of 4% aluminum be worked at a profit? S. Battle, Wyoming.

No. What is the principle of the dry washer? Where can it be best used and how does it work? Does it need much skill to run? Where is it made? T. V. Rossland, B. C.

Wherever it is impossible to get water for placer mining, and the conditions are such that a dry washer can be used, such an apparatus is employed. The device is based upon the same principle as a "fanning mill." It is used in southern California, Arizona, New Mexico, West Australia, and in general wherever there is surface placer gold and no water. There are different styles of dry washers in use in many desert mining regions. One general description fits them all, since their difference consists merely in peculiarities of adjusting their several constituent parts, as the angle of the apron, mesh of screen, height and number of riffles, etc. Essentially

it consists of a strong wooden frame, to the bottom of which is attached a bellows, the top of which forms the riffle board, consisting of wire netting covered by canvas, across which the riffles are nailed. Above the riffle board is the apron, and above it the screen. A crank and gear sets the bellows in motion and, by percussion, gives a shaking movement to the apron. While one man is turning the crank another shovels the pay dirt into the screen, through which it falls on the apron and from it on the riffle board. The intermittent blast blows the light particles of dust and sand away, while the heavier ones, and with them the gold, are caught by the riffles. After a number of shovelfuls of dirt (from 50 to 100) have been run through the machine the riffle board is taken out, the larger particles of gold are picked out by hand and the rest is dumped on a sheet of canvas, to be once more run through the machine at the close of the day, or when a sufficient quantity of the concentrated pay dirt has been collected. Such a method entails loss; still, it has been demonstrated that experienced men can save, under certain circumstances, up to 80% of the gold contained in the material worked. It does not take much skill to operate one. Any advertiser of general mining machinery can furnish one if desired.

What is added to blue print solution to insure better result?
Baker City, Or. S. F.

Some photographers add to the sensitizing mixture five drops of a 10% solution of bromide.

I saw a statement in some paper some time ago that where a placer mining claim was located in accordance with the legal subdivisions it was not necessary to mark lines and set stakes and erect monuments. Is this correct?
Josephine, Cal. J. W. E.

The most recent ruling of the Interior Department on this question is that where a placer claim is on unsurveyed lands and conforms to legal subdivisions no additional survey or plat is required when application is made for patent. It is, however, necessary in all such cases to make full compliance with all other requirements not specifically exempted.

I want some reliable information as to scrip for oil lands and, in general, titles thereto, and am told that your paper is authority thereon.
Bakersfield, Cal. F. O.

The subject is an extensive one. Probably the best thing would be to read "Scrip and the Law of Title to Oil Lands," a monograph written by an expert mining lawyer for this paper, and which appeared in the issues of April 7, 14 and 21, 1900. It takes up the whole subject in detail, explains it and gives the exact law regarding it. The article contains about 10,000 words and is authoritative. The matter is one of present litigation and is under argument this week at Washington, D. C., before the Interior Department. It will probably never receive final settlement till decided by the Supreme Court of the United States.

Where and how are the black diamonds or borts mined such as are used in diamond drills? What is the difference between the two? What are they worth and who sells them?
Santiago de Costa Rica, C. A. J. De V.

Black diamonds are found in the province of Bahia, Brazil, and are divided into two varieties, carbons and borts, the first occurring in irregular crystals, with granular structure and no distinct cleavage, hardness as great as that of the diamond, density inferior on account of porosity, resinous luster, grayish or black in color. The bort is spherical and without the irregularities shown by the carbons; it is grayish or black, translucent, taking the form of round masses with a rough or crystalline structure. The demand is constantly increasing and the price remains high. The region where the black diamonds are found is about one day's journey from Bahia by boat to San Felix and by railroad to Bandeiro de Mello. The most productive region is found beyond the river Paragason. On account of the primitive methods of extraction the only places from which they are taken are the bed of the river and its tributary, the San Antonio, and from the sides of the Sierra des Levas. The carbons are found in a kind of gravel consisting mainly of quartz pebbles mixed with ferruginous clay and resting on a clay stratum. A spot is chosen in the bed of the river where it is not more than 20 feet deep and where the current is slack. A long pole is planted, down which the native descends, provided with a sack whose mouth is stretched open by an iron ring. The clay is scraped from the bed of the stream and the sack filled with gravel. It is brought up and taken to the shore, the sacks being stored out of reach of high water. This operation is carried on each day for the six months of the dry season. During the rainy season the search is suspended on account of the current and the great depth of the river, and the gravel is washed and examined for carbons. The parts of the river having great depth are not worked. Here dredgers or diving apparatus might be used to advantage. Another method of extraction consists in perforating the sides of the mountain along the shore. A number of tunnels have been made for the extraction of gravel containing diamonds and carbons. The work is carried on during the dry season and in the

rainy season the gravel is washed in cradles or by similar methods. The carbons are found in dimensions varying from a grain of sand to crystals weighing 975 carats. The largest was discovered in 1894 and sold at Paris for \$20,000. The size preferred is that weighing from one to three carats, as the large masses must be broken, with considerable loss. The carbons in rock drills are disposed on a steel crown in circles or rows.

Will you please answer for me these two easy questions? How can I connect telephones to a 230-volt direct-current lighting circuit so that they will work satisfactorily while the lights are on?
No. 2. How are tappet gibs made, and why are not they interchangeable between tappets of the same size?
Hedges, Cal. G. F.

Those questions are not "easy." It took some effort to properly produce answers. Answering the first question, it would not be possible to connect up a commercial telephone apparatus on a circuit carrying a 230-volt direct current of electricity. The receiving telephone is equipped with a spool of No. 36 silk insulated copper wire; this will fuse in five seconds with a 2½ ampere charge, which is the quantity that would be forced through 90 ohms under 230-volt pressure. The bridging bells now used on telephone circuits have 1000 ohms resistance and ½ ampere would be forced through. These spools would take fire in about twenty minutes.

In reply to question No. 2, the tappet for the stem of a stamp battery is made as follows: The pattern of the tappet is rammed up in sand enclosed within a box called a flask, the bottom portion, A, (see illustration) being called the drag, and the top portion, B, the cope. After the pattern of the tappet has been withdrawn, the core C-D, with the iron gib E wired to it, is placed in the mold; the cores F-F are then put in place, the flask closed and the metal

poured in. The reason why the tappet keys which go into the openings left by the cores F-F are never alike is as follows: The core C-D, which is made up of dry sand, is made in two halves and pasted together: this operation very rarely, if ever, produces two cores exactly the same diameter, and as this diameter determines the distance from center of tappet to back face of gib, it will be seen that the depth of the key opening F is greater or less as the diameter of the core C-D is greater or less. While it might be possible to make the core C-D of standard size, this would not overcome the difficulty entirely, as the molten metal when poured into the mold generates gases that cause disturbance sufficient to destroy exact measurements and render it impossible to make keys duplicates of each other.

Can you inform us of any plant in operation where the tailings from a concentrator containing native, ruby and antimonial silver to the amount of ten ounces or less to the ton are treated successfully? If so, kindly give the desired information.
Neihart, Montana. F. G. J.

At the Minnesota mine, Chloride, Mohave Co., Arizona, an almost precisely similar problem is to be undertaken by Manager E. T. Loy, who says he will put in pans and settlers. He is now preparing for the treatment of just such ore, and his experience may be of interest and value. Some extended reference to this matter appeared on page 136 of the issue of the 16th inst.

We have over 500 pounds of nitro powder (40%) here, which was manufactured in 1898; it has been in our powder house for over two years. The powder got wet many times and was thawed out during summer; it is full of white crystals and blisters and some sticks have increased one-third in size. Will this powder be more dangerous to handle and use in a mine than fresh powder? Will nitro-glycerine evaporate at ordinary temperatures and the residue be non-explosive?
Summitville, Colo. C. L. G.

The white crystal is nitrate of soda, and from the description there is doubtless considerable nitro-glycerine on the outer side of the paper. Not alone is the powder dangerous, but it is of no practical

value as an explosive, as its power has been very considerably reduced, probably 60%, and the best thing our correspondent can do with it is to dispose of it—throw it into some abandoned shaft or burn it up by means of fuse and cap. If dynamite is confined in a very close place and it is extraordinarily hot—say, the temperature from 90° to 100°—it becomes sweated and loses in strength. In handling this powder the utmost caution must be observed in disposing of it, as no doubt the cases in which it has been placed are also saturated with nitro-glycerine, and if he scrapes it against the buttons of his coat or the side of a wagon it is liable to explode.

Tell me the horse power necessary to operate a Hartz jig of two compartments and also of four, under different conditions of stroke and speed and classes of ore. I am unable to get any information in technical books on this subject.
Lead, South Dakota. B. H.

It is not possible to give exact answer to so general a question, as individual or local conditions largely determine those things; but, based on experience, it requires about ½ H. P. for a two-compartment jig and 1 H. P. for a four-compartment jig. Of course, this depends somewhat on the character of the ore bed on the screens, also upon the weight of the ore, some ore being much heavier than others.

Is not 10 feet of work sufficient to comply with the annual assessment law for work on mining claims? I hold that it is.
Lake City, Colo. S. T. T.

The law requires \$100 worth of work, and not any number of feet. In several Colorado districts it has become customary to call 10 feet sufficient compliance with such law, but the federal law is supreme, and, if required, the holder of an unpatented mining location must be able to show work or improvements to the extent of \$100 for the year. Not to do this is a risk. Of course, if he does only \$5 worth of work or none at all, he can go on if no one gives him trouble, but in case of dispute \$99 worth of work would not count if the matter were brought within the strict letter of the law.

Can you tell me of any practical method for saving platinum when the same is associated with fine gold in placer ground? We concentrate the platinum all right with the gold, but final amalgamation of the gold does not save the platinum.
Minidoka, Idaho. F. S. C.

Platinum does not amalgamate. It can be separated from fine gold by amalgamating the gold, working out any platinum the amalgam may hold mechanically, and finally washing the platinum, to free it from sand, sulphurets, etc.

Assayers who have handled platinum separate the free gold by amalgamation, and say, where any platinum is held mechanically in the amalgam, it can be separated by working it by hand, when the platinum will come to the surface and can be separated. The platinum can afterwards be separated from the sand or other foreign material by panning, the same as free gold can be separated from quartz or sand. We do not know of any mechanical plant for concentrating platinum from sands, the only method to be pursued being to pan it out by hand.

I have heard of some contrivance used in northern California for cheap working of placer claims, a kind of scoop or primitive dredge. Can you give any information from this meager outline?
Bannack, Montana. A. R.

Probably is in mind a device used by gravel miners in Siskiyou Co., Cal., in working gulch and creek bed claims where there is deep bedrock. It is, briefly, a scoop guided by a slanting cable, extending about 150 feet to bottom of diggings, 30 to 50 feet deep in an open cut. In successful cases the plan dispenses with a pump or derrick, scooping up gravel and water, about a ton a load, one man at the engine and two in the cut, but it is only applicable in a small way and is not in general use.

I want a simple test for copper in ore, not one of those elaborate laboratory tests you occasionally print, but something I can use right on the trail without any apparatus.
Wickenburg, Arizona. M. V.

Crush the ore sample; grind it very fine, make pulp of it, roast the pulp; then mix and well knead into bulk for bulk of salt and candle grease or other fat, and throw it into the fire; this last is best done at night. If copper is present the spluttering mass will show first blue, then green. For a quantitative analysis or assay you must have apparatus and skill.

A multitude of other questions are more briefly answered, as usual, in "Concentrates," page 145.

Notes on Gold Milling Practice at the Athabasca Mine, Nelson, B. C.*

A casual inspection of the ore on the floor of the breaker room would create the impression that the ore is not suitable for milling at all. The general features are a hard bluish quartz, containing a large proportion of sulphides of zinc, lead and iron, showing free gold only when the ore is of fair grade, say from \$30 per ton upwards in gold values; and then usually closely associated with the lead and zinc sulphides. At times the entire ore body consists of solid sulphides, usually under these circumstances of either iron or zinc. We are not in the habit of making regular analyses of the ore, but in December we took a sample from the ore pulps of the mill runs of December 2nd to December 15th, inclusive: The contents were as follows: Gold, 1.35 ounces to the ton; silver, 45 ounces to the ton; zinc 2.20%; lead, 1.60%; iron, 10.70%; sulphur, 6%; silica, 68.80%; lime, (Ca O) 1.90%; alumina (Al₂ O₃) 6%.

The average gold contents recovered in the mill, during last year, was over one and one-half ounces per ton and during the month of June reached very nearly three ounces per ton. A feature of the ore, which assists recovery in the mill, is the free gold imbedded in the zinc and lead sulphides, in samples where no sign of quartz is visible. I have before me a remarkable sample of fine grained galena, 1 inch high, $\frac{3}{4}$ -inch broad and $\frac{1}{2}$ -inch thick, which is pierced by a wedge of gold, shaped like an Indian arrow head, $\frac{3}{4}$ -inch long, $\frac{1}{8}$ -inch broad at the base, tapering to a point at the other end. The mill contains ten stamps, working in two batteries of five stamps each, frame of the front knee type, battery posts 12x25 $\frac{1}{2}$ inches, knee frames 12x17 inches, girts 12x13 $\frac{1}{2}$ inches, the whole bolted together in the usual way, cam shaft of steel, 5 $\frac{1}{2}$ inches in diameter, fitted for Blanton cams. Ours are arranged in the order of drop 1, 3, 5, 2, 4, and while this plan does not seem suitable to our case, we are unable to experiment with any other style without a new cam shaft. I think it would be an improvement if, in sending out these shafts, the manufacturers should drill them for the wedges, so that the order of drop could be changed. We find that the pulp banks up around No. 1 stamp and this both impedes the action of this stamp and interferes with the amalgamation in this end of the mortar. With a view to overcoming this difficulty our practice is to give the end stamp about $\frac{1}{2}$ inch more drop than the middle stamps. The cam shaft works in open boxes. The guides are individual guides of maple with grain of wood up and down; each guide block held together by two $\frac{3}{4}$ -inch bolts running across grain of wood, with head and nut countersunk; each pair of guides held in place by two $\frac{3}{4}$ -inch bolts running through guide rail; a hard wood wedge driven home between each end pair of guides and the battery posts, and secured by a bolt. These guides give excellent service, if care is taken to have the guide blocks thoroughly seasoned before fitting; the cost of renewal is very slight, and they have the inherent advantage of all sectional guides.

The cams and tappets are of steel; latter fitted with three keys; after twenty-four months wear we have not yet had occasion to turn one tappet, and the cams show no sign of wear; they work smoothly and consume practically no grease.

The stems are of steel and we have not yet, after twenty-six months use, had occasion to even turn one of these; bosses or heads of cast iron, shoes and dies of forged steel.

The stamp when new weighs 980 pounds; speed varies from 80 to 115 blows per minute, according to the requirements of the time, with a drop of from 5 to 8 inches.

We stop on the first day of each month to clean up the amalgam in the mortars, lace belts and so forth, which stoppages aggregated last year eight days and seventeen hours; besides these delays we lost four days and twenty hours. Our motive power is entirely water; working under a head of 398 feet. We employ two impact wheels, one a motor 2 feet in diameter, which operates stamps, rock breaker, electric light plant and cyanide plant; the other a 12-inch motor which operates the vanners only, and of which the speed is never changed.

Width of mortar at point of discharge, 14 $\frac{1}{2}$ inches; height from top of die (when new) to bottom of screen discharge, 6 $\frac{1}{2}$ inches; die, 6 $\frac{1}{2}$ inches deep; when the die is worn out, the height of the discharge is as much as 11 or 11 $\frac{1}{2}$ inches. Screens of diagonal slot pattern; our practice is to employ a 50-mesh screen when dies are new, a 40-mesh screen after thirty days wear, 30-mesh screen when dies are wearing low; a mortar arranged on these lines is not designed to attain high records of crushing; the greatest tonnage which we put through was during the month of January, 1899, when we crushed 713 tons in thirty days, seven hours, or two and one-third tons per stamp per day; pulp after passing over plates is sized in a cone sizer, passes in grades of size to four vanners, first or coarsest grade passing over a 4-foot corrugated belt, the other three grades passing over 6-foot plain belts. Tailings from the vanners have, up to the

present time, received no further treatment, but will be treated in the cyanide plant.

COPPER PLATES.—These are arranged as follows: One back plate inside the mortar, 10 $\frac{1}{2}$ inches by 51 $\frac{1}{2}$ inches; one chock block plate inside the mortar, 3 $\frac{1}{2}$ inches by 50 inches; one lip plate outside the mortar, 8 inches by 54 inches; one apron plate outside mortar, 56 inches by 120 inches. All electroplated one and one-half ounces of silver to the foot; apron plate has a fall of 1 $\frac{1}{2}$ inches to the foot; just sufficient water is kept flowing over it to keep pulp from banking on plate.

The practice is to dress apron and lip plates five times each twenty-four hours, using as a cleansing solution a warm solution of dilute cyanide and sulphuric acid; plates brushed up with a hair scrubbing brush and smoothed off with whisk brooms, brushed across the plates. Fresh quicksilver is applied before the brushing process in quantity as may be necessary. In this way plates are preserved beautifully soft and clean; amalgam is removed every two days from apron plates, a small piece of rubber being used as a scraper. Every sixth day the screens are removed, lip plates cleaned of amalgam, and all trash and chips cleaned out of the mortars; the chock block plate, and back plate inside the mortar, are only removed and cleaned at general clean-up first day of each month.

The amalgam is cleaned with fresh quicksilver and squeezed as dry as possible. In this condition the amalgam from the plates outside the mortars contains about 20% bullion and the amalgam from the plates inside the mortars from 30% to 45% bullion.

ASSAYS.—At least four assays are made daily:

1. Of the ore at the feeders.
2. Of the pulp as it leaves the last plate.
3. Of the tailings.
4. Of the concentrates.

The sample taken at the feeders cannot be considered a satisfactory sample, but averaged over a period of several days, the results are fairly good. For the year 1900: The average of the feeder samples was \$44.38; the average of the tailings samples was \$8.71; the theoretical recovery was \$35.67; the actual recovery was \$33.66.

The theory under which we have been working is that the gold should be given as early and as ample an opportunity as possible to amalgamate, and for this reason we have held to the use of as large plates inside the mortars as possible. For this reason, and in order to preserve the back plate intact, we do not alter the height of the chock block which carries the front inside plate, and in this way the level of discharge is always the same. In this way there is very little tendency to scour the plates, excepting (to a limited extent) around stamp No. 1 where the pulp is banked up by the action of the stamps; and the change of screens, as aforesaid, offsets the increasing height of discharge which is produced by the wear of the dies. After the run of the month of June, we cleaned off the plates inside the mortars, 3183 ounces of amalgam, which produced about 925 ounces of bullion or 64% of all the bullion recovered. During this month our percentage of recovery was 81% of the value of the ore. My opinion is that our loss consists, almost entirely, in the sulphides; and that our loss in amalgamable gold is slight. From June until the end of the year, our percentage of recovery steadily fell to 77.6% in November, corresponding with the proportion of bullion and concentrates recovered:

Month.	Total amount recovered.	Percentage by value to Bullion.
June.....	81.0%	21.5%
July.....	80.7%	24.0%
August.....	79.6%	29.2%
September.....	79.4%	27.8%
October.....	78.4%	29.7%
November.....	77.6%	38.7%

To ascertain what proportion of sulphides were being lost, we sampled and analyzed our ore pulps during December. During this period 230 tons of ore were milled, producing 26.7 tons concentrates which, when sampled, assayed as follows:

Gold.....	2.67 ozs. per ton.
Silver.....	6.00 ozs. per ton.
Zinc.....	5.5%
Lead.....	4.8%
Iron.....	34.3%
Insoluble.....	17.6%

If all the above figures are correct, and 900 pounds of ore should produce 100 pounds concentrates, then 900 lbs. ore should yield $900 \times 2.2\% = 19.8$ lbs. zinc. 900 lbs. ore should yield $900 \times 1.6\% = 14.4$ lbs. lead. 900 lbs. ore should yield $900 \times 10.7\% = 96.3$ lbs. iron.

Actual results are:

In zinc we recover	5.5 lbs., or loss of 74%.
In lead we recover	4.8 lbs., or loss of 67%.
In iron we recover	34.3 lbs., or loss of 65%.

The absolute accuracy of these figures is open to question, but I am satisfied that the general tenor of them agrees with our results in practice and they point to a serious need of additional concentration facilities. Our experiments, however, with the cyanide process for the retreatment of our tailings seemed to offer such excellent chances of success that we decided to install a plant of this description and did not further consider the improvement of our concentration plant.

Fineness of bullion varied during last year from

682.5 to 747.5, with an average for the year of 725.3. The fineness seemed to vary as the quantity increased—the bigger the brick the higher the grade. It also seems to vary inversely with the proportion of concentrates recovered.

The number of tons crushed during the year was 5054, which produced 520 tons concentrates, or 10.2% by weight of the ore. The actual recovery in bullion was \$25.62 and in concentrates \$8.03 per ton; of the values recovered the bullion supplied 76%; concentrates, 24%; the value of tailings, \$8.71 per ton; percentage of recovery, 79.4. The tailings have been impounded in a dam pending the completion of the cyanide plant.

An iridescent brass-colored stain constantly forms on the apron plates. I use the word stain because it is so thin and in such a fine state of subdivision that, when gathered up in water, its appearance is that of a dark-colored solution. Fresh quicksilver, when applied to the plate covered with this stain, instantly adheres as readily as though the plate were bright, and it does not seem to interfere with amalgamation in any way. It is instantly removed with the first stroke of the brush, and, when the brushing process is ended, I have seen the stain reappear within fifteen seconds after the clean water has been turned on, before the attendant has time to release the first stamp. We have only made very slight investigation into the nature of this stain. Without more than suggesting that it has any connection with the above, I may here draw attention to the fact that, while the iron sulphides are apparently entirely composed of common iron pyrites, FeS₂=sulphur 53.3% and iron 46.7%, yet in the analyses of our ores and concentrates, we seldom find more than from one-half to three-fourths enough sulphur to satisfy the iron in the formula FeS₂, not to speak of the sulphur necessary to satisfy the zinc and the lead.

A curious feature of amalgamation was noted when the mill first started. Amalgam was formed on the front plates in remarkable quantities which, when retorted, produced an insignificant amount of retorted sponge.

During the first ten days of November, 1898, 1755 ounces of amalgam, squeezed dry, produced 161.8 ounces of bullion, or 9.1%. This had been even more remarkable during October, and the same feature continued during the following three months, after which it became normal.

We make bricks weighing from 400 to 500 ounces each. We use a flux as follows: Borax glass, 100 grammes; bicarbonate soda, 50 grammes; glass, 600 grammes; stir to excess with an iron rod. After skimming the slag, the brick is poured and is found in the mould with a heavy layer of matte on top. This is removed and the brick remelted under the same conditions. This process insures clean bricks in our case. The matte and slag are saved, and, after the product of six months has accumulated, it is retreated in the pot with niter and litharge, and the resultant lead is cupelled. The residues are again treated in a similar manner, which second process removes all the value except traces of silver.

Treatment of Fahlerz Ore.

TO THE EDITOR:—I may say that "C. R. C., Denver, Colo.," may be governed by the quality of the fahlore, to which he refers in his inquiry in the issue of Feb. 23rd. It will depend entirely on the values contained in the ores, and the degree of mineralization—whether the entire mass is impregnated with mineral, or whether there is more or less clear gangue with it, or mixed. If the material is rich enough, I would suggest sorting and shipping to a smelter having suitable flux ores to make a successful reduction.

If the greater part is gangue, which, I believe, is about usual, crushing with rolls to $\frac{1}{4}$ inch in size, jigged, the tailings from this operation put through a Huntington mill grinding to 40-mesh fine, then concentrated, the concentrates from this, with those from the jigs, shipped to the smelter, and the tailings from the fine concentration amalgamated in Washoe pans, good results may be obtained. This will give more satisfaction than any of the various processes I have tried.

I worked on such ores for a long time, and after many experiments this was found to be the best.

My jig concentrates gave 140 ounces silver, \$62 gold, 18% copper and 14% lead, with 11% metallic and oxide of zinc. The fine concentrates varied very little from this; but all concentrates contained practically all the lead, zinc, arsenic and antimony, leaving the tailings from the last operation comparatively free of these base qualities. These tailings contained about twenty ounces silver and \$7 gold. This latter material was amalgamated in pans containing two tons each, with thirty pounds salt and ten pounds sulphate of copper to each charge, run hot two hours with chemicals, then adding 125 pounds quicksilver and run five hours longer.

Fahlore slimes considerably. These slimes should be caught in large tanks outside the mill, and, when sufficiently hard, taken into the mill and about 700 to 800 pounds put into each pan charge to make up the two tons.

These slimes contained a considerable percentage of antimony and arsenic, and averaged about ninety ounces silver and \$35 gold, making the pan charge average about thirty-two ounces silver and \$14 gold

*Condensed from article by E. N. FELL, read before the March, 1900, meeting of the Canadian Mining Institute.

per ton. Extraction from this process averaged 83% silver and 92% gold.

The quicksilver showed tendencies to flour. About an ounce of cyanide of potassium added to the pan about two hours before discharging will have good results. Loss of quicksilver was about six pounds per ton of pulp.

I made many attempts to test the concentrates on the premises by a chloridizing roast and amalgamation; but the loss of gold and silver by volatilizing in the reverberatory furnace would frequently reach 50% of the assay values. J. W. PINDER.
Groveland, Cal.

Mining and Metallurgical Patents.

Patents Issued March 12, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

AMALGAMATOR.—No. 669,422; O. Maris, Russia-ville, Ind.

Sluice for amalgamators, etc., having series of parallel, transversely extending plates secured thereon, each plate comprising working plate having longitudinally extending, parallel, alternately arranged, overlapping slots therein, rounded ends to slots, base plate, slotted, flexible material between base and working plate, bolts engaging parts of each sluice plate adapted to bind same together, concave walls to slots in working plate converging toward upper surface thereof, lower edges of walls registering with edges of slots within flexible material.

GRAVITY AMALGAMATOR.—No. 669,671; J. Tobin, Brooklyn, N. Y.

Combination with mercury pot adapted to contain body of mercury, supports therefor, of diaphragm dipping below surface of mercury, extending across pot, dividing it into two chambers, stand pipe covering one chamber adapted to feed pay dirt into chamber, oscillating stirrer pivoted to exterior of stand pipe extending into open chamber of pot, extension on stirrer reaching under diaphragm and above surface of mercury on inner side of diaphragm, pump connections for supplying water to upper end of stand pipe, means for operating stirrer and pump.

GOLD SAVING MACHINE.—No. 669,873; T. Bell, Vancouver, B. C.

In machine for saving fine gold from sand or pulp; tank having bottom sloping slightly down from each side toward center; V-shaped partition in tank dividing it horizontally into two parts, upper and lower; cylindrical opening in center, cylinder of which forms inner wall to V-partition; conical amalgamator

adapted to float within cylinder on water in tank, adapted to rotate therein on vertical axis, means carried by conical amalgamator by which water and pulp are conveyed from lower to upper division of tank; means whereby water and sand are introduced to lower and tailings withdrawn from upper divisions.

HYDRAULIC AMALGAMATING MACHINE FOR EXTRACTING GOLD FROM SAND IN PLACE.—No. 669,911; G. S. Bartholomew, Los Angeles, Cal.

Hydraulic amalgamating machine for extracting gold from sand in place, combination of tube open at lower end; means for forcing water through tube; tube surrounding open-ended tube closed at lower end, provided with lateral openings through walls near lower end; means for forcing water through tube; cup fastened to tube below openings; amalgamating plates extending up and down above openings.

MOLD FOR STEEL CASTINGS.—No. 669,952; W. Brinton, Highbridge, N. J., assignor to Taylor Iron & Steel Co., same place.

Mold for producing castings, comprising metallic portion to chill contained metal, sand portion to permit more gradual cooling of metal adjacent thereto, an intermediate zone composed of continuations of metallic and sand portions of mold in juxtaposition, both exposed to contact with incoming molten metal, arranged to decrease rate of cooling adjacent metal of casting from chill to sand part of mold.

DRY WASHING MACHINE FOR GOLD.—No. 669,928; L. D. Hubbard, Chicago, Ill.

In machine of character described, bed plate having transversely extending grooves on upper surface for containing mercury, suitable inlets and outlets

for grooves, upper track provided with downwardly extending curved ends, lower track having upwardly extending curved ends overlapping curved ends of upper track, endless brushing apparatus provided with series of brushes pivotally connected together, having wheels carried by pivoted connection traveling upon tracks, means engaging pivoted connection for causing travel of brushing apparatus.

CRUCIBLE.—No. 669,862; P. Shimer, Easton, Pa.

Crucible having hollow stopper, cooling chamber gasket interposed between hollow stopper and chamber, means for connecting stopper with chamber for circulating cooling medium through stopper, overflow of cooling medium passing by connecting means into chamber, outlet for cooling medium from chamber.

The Lunkenheimer "Universal" Hand Oil Pump.

This form of oil pump is preferred by some users to the lever pattern, which the Lunkenheimers originated and have sold for over twenty years. The "Universal" hand oil pump can be made to attach either vertically or horizontally by transposing plug B and shank A, which are interchangeable. As shown in cut, it is arranged for vertical connection.

The filling hole is closed by a hinged cap, which keeps out dust and dirt, and, in addition, there is a removable wire gauze strainer to insure clean oil. Where required, these pumps can be furnished with brass instead of glass body, as shown in cut. They are manufactured by The Lunkenheimer Co., Cincinnati, Ohio.

The American Expansion Pulley.

The American expansion pulley has for its most prominent feature a cone of rods loosely mounted on a shaft, to slide laterally along the shaft while same is revolving, this lateral motion spreading apart or contracting, according to the direction of the motion.

The pulley operates singly in countershaft form, with an idler pulley to take up the slack of the belt, as shown in the illustration. At the Allan mill, Idaho Springs, Colo., Herbert Strickland superintendent, has one of these pulleys built into a Wilfley concentrator, and made a part of the same, and another, in countershaft form overhead, operating a Cammett concentrator. He says the pulleys give him absolute control of the speed of his concentrator and effect great saving.

H. E. Wood of Denver, Colo., who has been using this pulley for nearly a year, says: "I consider this

pulley an absolutely essential feature for concentration tables, the improved results being apparent at once." The pulley is made by the American Expansion Pulley Company, Denver, Colo., who will furnish full particulars.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

"Ice in the ocean went out yesterday," says a Nome letter of Dec. 13, "and the sea is clear of obstructions except for a space of half a mile wide along the beach." The coldest weather experienced up to that date was 14° below zero. Nome people hear from the outside world every two weeks, the mail being carried in over the ice that often.

Rampart City during the winter has had a population of 400. Not more than ten of these have made more than wages. Slate creek, on which a strike was made in the fall of 1900, has not developed anything this winter. Big Manook is no better now than it was last fall. Practically no companies have made money on Hunter, Hoosier, Quail, Russian or Gurnett creeks, all of which were regarded as rich in the fall. In May it is expected that at least 200 of the present population of Rampart City will leave for the States, not to return. Fifty more will migrate to other camps.

ARIZONA.

COCHISE COUNTY.

The Calumet & Arizona M. Co. has been organized at Houghton, Mich.; capital \$2,500,000. The mines of the company are located at Bisbee.

GILA COUNTY.

The Arizona Commercial Co. has two mining claims at Globe, the Defiance and Copper Hill mines.

MARICOPA COUNTY.

Wickenburg, in the northern part of Maricopa county, is the supply center for a considerable area of mining country both east and west therefrom. Sixteen miles southwest is the Vulture mine, which recently passed into new hands, who are preparing to resume operations. This mine is well known and has an interesting history, and those now in control are expected soon to place it again in the rank of active producers.

West and northwest from Wickenburg, from 50 to 60 miles, are the Harqua Halas, where there are numerous properties which are producers.

But the main purpose of this article is to call attention to the Black Rock district, 12 to 18 miles northeast from Wickenburg, in the Silver range of mountains. This is a little group or range of hills which are separated from the Date creek range on the north by the Hassayampa and from the Bradshaw range on the northeast by Castle creek. This region has been covered by mining locations for twenty years, but not much active work resulted till within the last two or three years. So far as a brief investigation could determine, it may be stated that there are three parallel fissures trending through the district from southeast to northwest, approximately a mile and a half apart, each of which follows the course of a porphyry or diorite dike. These fissures and dikes mark the course of a mineralized zone, bounded by a granite formation. Within this belt is a kind of lime and spar formation, which forms the vein walls, the surface cropping being in an iron gossan. There are, likewise, various cross ledges and veins that are deflections from the main fissures. The ores, carrying copper and gold, are considerably oxidized near the surface, but change to a sulphide at water level. These statements are intended to apply in a general way, bearing in mind that different and varying conditions are to be found as one goes from one property to another. On the east side of the district, drained by the Buckhorn, is Octopus hill, through which the center fissure passes and in which various north and south veins appear to focus. This and the immediate locality is covered by a group of claims belonging to Geo. W. Morgan, who has some development. Farther to the northwest, on the same center fissure, is the Keystone group, located by J. P. Gunther, who recently bonded it to the Keystone Copper & Gold M. Co., who put up gasoline power equipment and who are pushing development. The main shaft is 300 feet deep, the bottom of which is at water level. From the shaft is a considerable amount of drifting on the 100-foot level, which shows an ore body comprising bornite, chalcocite and black oxides. The copper herein runs from 2% to 3%, with small values in gold and silver. Here the vein matter is next to the main porphyry dike. Another shaft is also being sunk. As development proceeds, the method of treating the ore is being considered. This particular mine is more specially marked by copper characteristics than others of the district.

On the east fissure is the Groom mine,

which is being developed under the management of Geo. W. Middleton for the N. A. Exploration Co. This group covers two ledges, one being apparently an offshoot from the main ledge; the property is being developed by a shaft which is now 400 feet deep that sinks between the two ledges. Crosscuts are being run from the shaft both ways to cut the two ore bodies. The two veins are 350 feet apart. The ore is a copper sulphide, with very little oxidation at the top. The hoist and compressor are operated by gasoline engines. A steam boiler is being put in to add to the present pumping facilities. A strong flow of water has been obtained in the shaft, 30,000 gallons being pumped per day.

In the same locality is the Homestake group, belonging to J. W. Burson. The ledge of copper ore is being opened through an incline shaft which is now 360 feet deep. Near the surface the ore is quite oxidized, with more of a sulphide at greater depth.

Following northwestward on the same belt, toward the point where the Hassayampa divides the Date from the Silver range, we come to O'Brien's camp and a group of claims belonging to F. X. O'Brien, which covers what seems to be a portion of the east fissure and another ledge that has a northeast-southwest trend. The latter is known as the Homestake lead, whereon the principal development is to be seen. The ore body here is from 40 to 100 feet wide, dipping about 35° from the horizontal. The ores here are a free-milling gold quartz, these characteristics seeming to hold to the 350-foot depth of the incline shaft. In evidence of this, Mr. O'Brien operates a 10-stamp mill, by which he saves about 75% of his values on the amalgam plates, the tailings therefrom being cyanided. Contrary to the general characteristics of the district, this indicates the presence of very little base material and no copper. It is stated that there are about 200,000 tons of ore accessible in the mine.

On the west fissure, of the three named at the beginning, is the Ellis group and that locally known as the Standard Oil Co. group. The latter is being developed under the direction of Mr. Burridge of Santa Rita, New Mex., for Eastern people, presumed to be connected with the Standard Oil Co. At present a 400-foot shaft has been sunk, from which general exploration is in progress. At present depth the material on the ledge is pretty well leached and oxidized.

It should be stated, in conclusion, that this Black Rock district is in Yavapai county, though Wickenburg is in Maricopa county.

Wickenburg, March 18.

PINAL COUNTY.

The mine of the Mammoth-Collins G. M. Co. at Shultz is producing about 180 tons of ore per day, which is hoisted from the levels above the 700. From the bottom of the 700-foot shaft a crosscut is being driven toward the Collins group to tap a separate vein on the latter. As soon as the vein is reached by this crosscut an upraise will be made to the old 350-foot workings. A wire rope tramway line, 3 miles long, conveys the ore from the mine to the mill at Mammoth, on the San Pedro. The mill is equipped with seventy stamps, only fifty of which are being operated. The ores are tolerably free milling and no concentrators are in use, though it is said they have been tried, with the conclusion that the ores are not adapted to concentration. That which is not saved on the plates goes out in the tailings, with the expectation of extracting it by cyanide. The mill has been operating steadily for about three years.

The mill tailings are being operated on by two cyanide extraction companies, viz., the Mammoth Cyanide Co., in charge of M. Mendenhall, and the St. Louis Gold Recovery Co., under the management of N. Anderson, who is one of the company. The first-named have a lease on such tailings as have been produced within the last three years and those that result from present operations of the mill. Since beginning two years ago they have cyanided about 30,000 tons. The very complete plant comprises leaching tanks of 350 tons daily capacity, the usual precipitating apparatus and a Robins belt conveyor, run by a 40 H. P. engine, by which the material is carried from the dump to the leaching vats. The capacity of the plant is considerably in excess of that of the mill to produce tailings.

The St. Louis Gold Recovery Co., the chief stockholders of which are Anderson and Peck, have a lease on those tailing dumps which accumulated prior to three years ago, on which their plant has been operating since August, 1898. In that time, Mr. Anderson states, they have cyanided about 160,000 tons of material and perhaps 40,000 tons are still at their disposal. The assay value of these tailings ran \$3 gold and one and one-half ounces silver. The extraction amounts to 70% to

80% of the gold and 40% of the silver, the cost of extraction being 76 cents per ton.

In the Mammoth-Collins mine the workings have reached the water level and the operators will soon have to provide pumps for handling the water, and it is possible they may get into sulphides at greater depth, though as yet such ores have not appeared.

Mammoth-on-the-San Pedro, March 13.

The Golden Rule Copper Co., of which W. H. Lake of New York is president and manager, are beginning the development of a group of seventeen claims in the Catalina mountains, about 3 miles south of Oracle. Their locations cover the strike of the ore bodies for about 2 miles, as shown by the surface croppings. Three shafts have been started, two of which are down about 90 feet. This work discloses copper sulphide ores running as high as 24% copper, with considerable amount of gold. Mr. Lake thinks the ores will average 10% copper. He contemplates putting up a concentrating plant if the showing continues as good as now appears.

Oracle, March 14.

WASCOTT.

The Arizona Copper Hill M. Co. are developing a mine 5 miles southwest of Oracle and near Canyon del Oro. This company is made up largely of Denver men, J. D. Coplen being manager. The location covers an east-west vein in a granite formation. From the surface down to the present depth of shaft at 208 feet the ores are a green copper carbonate, rather low grade, but apparently of good width in the vein. The ideas of the company incline to the adoption of some leaching process, by which the ore may be treated at the mine. Besides a 208-foot shaft, the work includes 550 feet of drifting alongside the vein, about 100 feet of winze work and some crosscutting. A strong flow of water has been encountered and pumps may be required later. The hoisting is done by a gasoline engine.

Canyon del Oro, March 14.

It is reported in Tucson that Capt. J. D. Burgess has purchased for New York parties the Omega group and Penn mill-site, at Helvetia, from L. Zeckendorf. This property is said to join the Isle Royal of the Helvetia M. Co., and has a considerable amount of development in sulphide ores.

Capt. Burgess reports that he has a six months' lease and bond on the Maudina and Guadalupe groups, near Oracle, upon which he intends to erect a 10-stamp mill, with concentrators. The claims cover a ledge of ore which, in one place, is 60 feet wide, which shows good values in gold and lead by samples taken.

J. D. Moore and associates of Tucson are opening a property near Canyon del Oro, known as the Bonanza, whereon they have a ledge of ore from the surface which runs high in silver and galena. It is proposed to thoroughly develop the property.

Oracle, March 16.

YAVAPAI COUNTY.

The Blue Bell mine is located in a low range of hills, about 6 miles southeast of Mayer. It embodies a group of three claims, which end-line with each other, covering over 3000 feet of a mineralized zone, which trends nearly north and south. Present development indicates that the ore-bearing zone is between 400 and 500 feet wide, standing at a dip of about 14° from the vertical, between a diorite footwall and a whin rock hanging-wall. The material between the walls seems quite clearly separated into three strata, that next to the footwall being a chloritic slate, that next the hanging-wall a siliceous slate, with a diorite slate between. A peculiar thing observed is that the zone is crosscut at regular distances by narrow dikes of diorite, which stand almost vertically, cutting the formation at right angles. On that portion of the zone covered by this group there are five of these crosscutting dikes, from 500 to 900 feet apart. The ore found in streaks within the zone, and extending longitudinally with it, comprises a chalcocite, whose values, named in the order of their importance, are copper, gold and silver. The property is being developed through three different shafts, having a present depth of 300, 200 and 135 feet, respectively, besides which there are about 800 feet of work in drifts and crosscuts. To the depth of about 200 feet the ore would concentrate well, it is believed, but below that depth it becomes less suited to that method. The property belongs to Philadelphia parties, the management being in the hands of Ernest A. Haggott.

The extension of the branch of the S. F. P. & P. railroad from Prescott to Mayer, passing a short distance from McCabe, Chaparral and Big Bug, greatly facilitates the movement of machinery to the mines and mills of the districts named and the shipment of ore and concentrates to the smelters. Some further extensions are being considered, which take into account branches up Big Bug gulch, to Richinbar,

on the Agua Fria, and to the Crowned King, in the Bradshaw mountains.

Mayer, March 10.

WASCOTT.

The Octave mine and mill, belonging to the Octave G. M. Co., located southeast of Rich Hill, near the old village of Weaver, is mining and milling daily about 145 tons of ores that average approximately \$11 per ton. Of this, from \$2 to \$3 per ton are saved in free gold on the plates, \$2 per ton in concentrates, the balance of the saving being made from the tailings by cyanide work. All the mill tailings pass to a row of tanks where it is agitated by centrifugal pumps, allowed to settle, and then the sand is separated from the slimes by screw conveyors, the sand and slimes being subjected to cyanide in separate tanks, the slimes constituting about 10% to 15% of the tailing material. It is stated by mill superintendent J. McA. Johnston that the refuse after the leaching contains less than \$1 per ton. Small engines operate the centrifugal pumps and conveyors and a motor operates a blower by which air is forced up through the cyanide tanks. The other features of the mill were well described by Mr. D. E. Bigelow, in an article which was published several months ago. The mine is being worked through two shafts, 625 and 585 feet depth, respectively, which are inclines on the dip of the vein, the latter having an east and west trend. The two shafts are connected by drifts on the 500-foot level. A third shaft sinks on an incline 250 feet on the same vein, at a point 500 feet from the other shafts. The vein matter, capable of being milled, has a width of from 20 inches to 9 feet. Oil burners are being placed under the boilers and storage tanks have been put up at the railroad station and the Octave Co. expects soon to use fuel oil to generate steam.

Octave, March 12.

The new Congress mill will soon be completed and ready to operate. It will consist of forty stamps, 1000-pounders, to drop 100 to the minute, and twenty concentrating tables. The anvil blocks, under the battery, weigh seven tons each, set in concrete and the latter upon stone blocks. The new engine room contains a new tandem, compound Corliss engine and a cross-compound compressor of twenty drills capacity. The three new boilers, aggregating 400 H. P., are fed by automatic stokers. The concentrator floor is 40x100 feet and well lighted. There are no amalgamating plates here, the process being one of concentration and cyanide work. The tailings from the tables are separated into two classes—the slimes and coarse material. The slimes are roasted before being cyanided, the coarse passing to the cyanide tanks direct. About 15% of the tailing product is thus roasted. The new mill will run about 150 tons per day, a twenty-mesh screen being used at the battery. The cyanide facilities will be enlarged so as to handle about 300 tons per day, as there is still a large accumulation of tailings on the dump.

The Congress ores range in value from \$15 to \$20 per ton, the concentrates from \$150 to \$200. The old mill, which is pretty well worn out, will be overhauled and repaired.

The mine workings aggregate about 15 miles, on two parallel veins and one cross vein, there being three incline shafts on the main vein and one on each of the others. The principal incline is 3300 feet in depth on the dip of the vein, having levels with much regularity at 75-foot stations. By systematic underground work good ventilation has been secured. The ores are a white quartz and iron pyrite, the values being chiefly gold.

Congress, March 17.

CALIFORNIA.

AMADOR COUNTY.

In a crosscut from the north drift at a point 225 feet north of the east crosscut from the North shaft to the main Mother Lode fissure in the Kennedy mine, on the 2300-foot level, rich ore has been found, indicating that, as in other localities, deep quartz mining pays in this county.

CALAVERAS COUNTY.

The Kinross ranch mining property, near Whisky Slide, is to be bonded to Chicago men.

At the Demarest mine, on the 600-foot level, a 6-foot ledge shows gold. The mill is in constant operation.

An electric pump is contemplated to handle the water in the Lucky Boy mine.

At Robinsons, the tunnel between the South Carolina and Melones tunnels is successfully completed; there is now a total length of 4152 feet. Electric cars will carry the ore to the 120-stamp mill now building. The tunnel will drain the entire group on the Carson side. An illustrated technical account of the work in this tunnel appeared in the issue of Nov. 5, 1898.

The Prince mine, in Altaville, is bonded and will be worked.

In the Tenderfoot mine, at Murphys, a

recent lot of crushed rock showed a yield of \$1480 in free gold and \$125 in sulphurets to the ton.

The Angels mine shaft is to be sunk 200 feet deeper.

EL DORADO COUNTY.

P. R. Stuart and five assistants on the American river, above Placerville, are doing preliminary work toward a cable transfer across the river to convey lumber across the river canyon from the north to the south side and to carry machinery and provisions for the camps in the reverse direction.

The Church Union mine, near Placerville, is unwatered to the 1200-foot level, leaving 50 feet to clear before operations begin.

The St. Clair mine, at Kelsey, will put in a pipe line and use water, instead of steam power.

Near Georgetown, F. C. Leavitt will resume work on the Dometre mine.

The Contraband, 2½ miles southeast of Georgetown, shows ore assaying \$33.44 gold and six ounces silver per ton.

Near Grizzly Flats, at the Mt. Hope mine, W. R. Pearson is putting in 1800 feet of pipe line to convey power to a shaft on the north end.

FRESNO COUNTY.

The California Copper Syndicate, Ltd., has registered in London, capital £30,000 in £1 shares, to acquire copper and other mines, and in particular to acquire the mines known as McKinley, Last Chance, Heiskell, McKinley Extension and Heiskell Extension, in the county of Fresno.

KERN COUNTY.

The Union Trust Co. of New York has filed a \$25,000 foreclosure suit against the Randsburg - Santa Fe Reduction Works, at Barstow. The plant has been idle for some time. It is locally believed that should the plant be sold at public auction the owners of the Yellow Aster mine at Randsburg will bid it in and have it removed there.

MARIPOSA COUNTY.

Captain Ward, owning the Pinon Blanco group, has organized a New York company, incorporated under the laws of New Jersey; capital, \$2,000,000; work will begin next month.

At the Hite Cove mine is being treated 100 tons of tailings every twenty-four hours by the cyanide process. It is estimated that there are 40,000 tons, which may return \$5 to the ton.

MONO COUNTY.

At the Standard Con. mill, in Bodie, for the week ending March 9, 412 tons of ore were crushed; average assay vanner tailings, \$9.31; concentrates produced, 1.19 tons; assay value, \$90.39; amalgam produced, 1527 ounces; assay value per ounce, \$2.27.

NEVADA COUNTY.

A Grass Valley dispatch says the North Star ledge, in the central shaft, has been struck at a vertical depth of 1600 feet. In 1897 the North Star Mines Co. set aside an appropriation of \$100,000 to sink the shaft and develop the central, which it was calculated would cut through the New York Hill and North Star veins and enable the company to develop the whole of that section for a radius of a mile or more. This appropriation proved inadequate, but the work was continued with successful determination.

Supt. Starr authoritatively denies the statement that miners' wages at the Empire, Grass Valley, were to be reduced to \$2.50 per day. He will maintain the \$3 rate.

The Red Cross mine, at Omega, is to be reopened.

PLACER COUNTY.

The tunnel at the Azalea mine, near Blue Canyon, is in 2900 feet.

The South Yuba Water Co.'s Auburn reservoir has been cleaned and lined with rock and cement. It is 120x120 feet wide and 12 feet deep, and will hold about 1,000,000 gallons of water.

SAN DIEGO COUNTY.

Last week the record for the number of desert oil claims filed with the County Recorder was broken, the total number for one day being 116 of 160 acres each, 18,560 acres, and on the following day the number of claims recorded was 118, comprising 18,880 acres of desert land.

SHASTA COUNTY.

The well of the Shasta Con. Oil Co., operating in Cow Creek district, 15 miles northeast of Redding, is down 300 feet; drill is now in blue shale; owing to the cutting off of the water supply from the flume of the Terry Lumber Co., the company is building a reservoir for the storage of its own water.—The Northern California Co-operative Oil Co., Ltd., capital \$300,000, is incorporated at Redding to operate in Stillwater district.

The Mt. Shasta Co., Redding, is getting ready for active work and projects putting in a cyanide plant.

The statement is made that the Shasta

King mine has developed a large body of sulphide ore, and that a 500-ton plant will be constructed this year.

TUOLUMNE COUNTY.

At Columbia, the Gray Eagle mine will resume April 1. Korbel Bros. will sink a new shaft 300 feet.

A 20-stamp mill is to be erected at the California Ophir mine, Carson Hill.

At Jacksonville, the Clio mine will resume April 1.

The Marshall G. M. Co. and the Grizzly M. & M. Co. have incorporated at Sonora.

The Mt. Jefferson mill is expected by Supt. Meighan to be in operation by April 1.

The water is lowered sufficiently in the Rawhide to permit partial resumption of work. At its present depth of 1900 feet, the Rawhide mine forms a basin into which the whole Rawhide flat is drained.

COLORADO.

BOULDER COUNTY.

The Colorado & Northwestern Railway Co. will construct a branch line from Sunset to Eldora.—The shaft on the Terror at Eldora is down 200 feet, and 325 feet of drifting is completed. The vein is 6 feet wide and the ore is said to run from \$10 to \$500, according to recent mill tests.—A strike of rich ore is reported made on the 95-foot level in the Concord, in Sugar Loaf district.—The shaft in the Superior at Ward is down 250 feet; J. P. Olympus, Supt.—The Revenge at Eldora is shipping 200 tons of ore per month. The shaft is down 300 feet and 500 feet of drifts are run at that depth; Three Strikes M. & M. Co., operators.

At Wall Street the Yellow Pine group of claims, adjoining the Logan mine, is being worked with three shifts of men by the lessees, Older & McClure.

CHAFFEE COUNTY.

At St. Elmo the big tunnel by which the Golf M. & M. Co. is to cut the Mary Murphy vein at great depth, has been started at the foot of the mountain, and will run several thousand feet before it reaches the vein, which it will intersect at a depth of about 2000 feet. The present workings are near the top of Murphy mountain.

CLEAR CREEK COUNTY.

Manager Sims of the Sun & Moon Co. has begun work in the Newhouse tunnel.

Near Georgetown the Hartford M. Co., succeeding the Empress M. Co., will resume work on the Empress tunnel, in addition to the development of the Gold Dirt and other claims.

GILPIN COUNTY.

L. H. Stockbridge is in charge of the Cook, Fisk & Gregory-Bottall properties, Gregory district, recently operated by the Boston & Denver Con. M. & M. Co.

JEFFERSON COUNTY.

The pyritic smelter which the Clear Creek M. & R. Co. is building at Golden will have four furnaces and a daily capacity of 1500 tons.

LAKE COUNTY.

Six drill holes put down on the old Fryer hill bonanza have entered the sulphides 400 feet below the level of the top contact.

The Modoc at Leadville is making regular shipments of ore.—The Diamond G. M. Co., operating near Leadville, is putting in a new pumping plant and is sinking a new shaft; Supt. F. Brooks.—A station is cut and a new pumping plant is put in on the 500-foot level of the Valentine, near Leadville.—Sinking is resumed on the Butcher Boy group, in Ball Mountain district, and the shaft will be sunk to the 1000-foot level if necessary.

OURAY COUNTY.

Barbee & McMasters, at Ouray, will resume work upon the properties of the Ouray M. & M. Co.

SAGUACHE COUNTY.

Near Crestone the San Isabel M. & M. Co. has ore that runs 17% copper and some gold. The owners are preparing to put on a large force in both mine and mill. Page & Pollock of Canyon City have a bond and lease on the Carbonate King group, in Dimick gulch, for \$20,000, running one year. Their contract calls for 150 shifts per month.

SAN JUAN COUNTY.

The Henson Creek Lead M. Co. will start work on a dam and power plant to cost \$20,000. J. O. Smith is agent at Lake City.

Near Silverton, in the Evening Star, Mastodon gulch, Supt. Yeckels has a strike in the lower crosscut tunnel run to cut the Evening Star vein.

SAN MIGUEL COUNTY.

The sale of the Contention group of mines, Telluride district, for \$100,000 to the New England Exploration Co. is reported. The corporation is composed entirely of stockholders of the Calumet & Hecla Co., which is already the owner of

the Smuggler-Union in San Miguel and the Sunnyside extension in San Juan county.

The litigation which has kept the Summit gold mines tied up for the past two years is finally terminated in favor of the Colorado G. M. & M. Co., a Milwaukee corporation, who in 1899 purchased the property from R. H. Wilson, trustee.

The Keystone Hydraulic M. Co. has recently organized at Telluride, E. L. Davis resident manager, and will put in extensive apparatus and machinery to work 652 acres placer ground 3 miles from Telluride.

TELLER COUNTY.

In the Florence, Victor, 300 feet of drifts north and south are run on the 333-foot level.—Sinking is resumed in the Raalar of the C. K. & M. Co., on Beacon hill, near Victor. The shaft, now down 225 feet, will be sunk to the 270-foot level, at which depth a crosscut will be run.—J. H. White and others, operating the Eclipse, near Victor, are making steady shipments of ore from the 100-foot level. A crosscut is being run on the 200-foot level.—The unwatering of the Clyde is nearing completion and sinking will probably be resumed.—A recent report of the secretary of the Doctor-Jack Pot Con. M. Co. shows net profits of the company for February were \$89,000. Out of this a dividend of \$29,000 was paid, leaving a balance in the treasury of \$60,000.

The Anaconda G. M. Co. has transferred all its property to the Anaconda M. Co., the reorganized corporation, stamps indicating the consideration to have been \$700,000.

In the Elkton the water in the shaft has receded 3 feet. Supt. Camp will put in two pumps of a capacity of 600 gallons each per minute. Stopping continues above the water level.

Near Victor the Morning Star, E. R. Argersinger manager, is developing ore in two veins on the 140-foot level.

The Mary Cashen shaft is to be sunk an additional 425 feet.

At Cripple Creek the King Gold has a 7-foot vein that goes \$30 gold per ton.

IDAHO.

ADA COUNTY.

The property of the Owyhee Land & Irrigation Co. was sold under execution at Silver City last week for \$50,000 to Potter, Phillips, McCrillis & Gray of Providence, R. I., and C. F. Stullaber of South Farnsworth, Mass.

BOISE COUNTY.

The War Eagle placers, at Idaho City, will be started next week. Assistant Manager Woodburn says they expect an excellent season. They recently received 60,000 pounds of metal rifles for use in their big operations. All the eight giants will be run.

C. H. Souther, president Boston & Idaho G. D. Co., says he will put two more dredgers at work along More's creek.

LATAH COUNTY.

Near Moscow the Pleiades Golden Gate will resume April 15.—The White Cross, near the Golden Gate, will resume with a large force April 14. The company will put a 5-stamp mill on the property this spring.

SHOSHONE COUNTY.

At Wallace the Mammoth M. Co. has cuts vein in the lower tunnel, No. 6—the longest completed crosscut tunnel in the Cœur d'Alenes—3475 feet from the portal to the point of intersection of the vein. The Bunker Hill & Sullivan and the Empire State-Idaho companies have uncompleted tunnels that are now in farther, each of which will be about 2 miles long when completed.

WASHINGTON COUNTY.

The Sampson M. Co. is working the Irwin, Corie and Sampson mines, and has 7500 tons of ore blocked out which averages \$20 gold per ton; Mr. Cudmore of Spokane, Wash., is manager.

The Utopia M. & M. Co., E. B. Hollingshead manager, has a diamond drill at work on a 60-foot ledge which has now been prospected to a depth of 280 feet; the ore averages \$8 gold.

MONTANA.

CASCADE COUNTY.

On April 15th the entire works of the Great Falls silver smelter will close indefinitely.

DALY COUNTY.

The Butte & Boston and Boston & Montana Companies will discuss consolidation at a meeting in New York City April 2.

PARK COUNTY.

At Jardine, the Bear Gulch mine has produced over \$300,000, the final payment of nearly \$55,000 on the bond has been made out of profits twenty months ahead of time, the mine has over 9000 feet of development work and has a 20-stamp mill

in constant operation. C. E. Elkin of St. Johns, N. B., one of the directors, has asked for a lease and bond on the mines for \$1,100,000, which, if granted, will expire August 15, 1901.

The legal differences surrounding one of the principal mines in Bear gulch are at an end and plans perfected which will lead to the immediate resumption of work on the Bush properties.

SILVER BOW COUNTY.

All employers of labor in Butte have received notification from the Butte Workmen's Union that, beginning with May 1, 1901, the hours of labor in Butte for common or unskilled labor shall be eight hours only, the pay still to be the same or not less than \$3 per day.

The Farrell Copper Co. has bought 200 acres on the Meaderville flat for a figure close to a million dollars. F. Farrell is at the head of the enterprise. D. Gillies is superintendent, and has started a double-compartment shaft from the surface.

NEVADA.

ELKO COUNTY.

Near Wells, a California company, represented by G. C. Willis, has made extensive locations and will bore for oil. Surveyors from all portions of eastern Nevada are surveying locations.

HUMBOLDT COUNTY.

A deed for mining property has been filed in Winnemucca covering a number of claims in Granite Creek district, near Golconda. The Granite Creek S. & R. Co. is the purchaser; consideration, \$1,999,993; A. W. King, secretary. The deed bears two \$1000 revenue stamps.

NYE COUNTY.

The Nevada Co. has men at work on the Berlin mines, near Ione; a 25-stamp mill, lighted by electricity, is running.

STOREY COUNTY.

The Enterprise says that from a graphite mine discovered on the Ophir grade the owners are shipping to Sacramento and getting \$1500 per ton for the plumbago on board the cars at Washoe City.

WASHOE COUNTY.

At Steamboat Springs, a shaft is being sunk by J. H. Hopkins. Claims have been located for several miles east and west of the springs.

At Olinghouse, the Slip mill is running on gravel, reducing thirty tons per day.

WHITE PINE COUNTY.

A new combination 150-ton mill will be put in at the Chairman, Ely. A final payment of \$50,000 on the property was recently made.

NEW MEXICO.

BERNALILLO COUNTY.

Reports from Bland are to the effect that the Cochiti mine produced \$26,000 gold and made about \$6800 net in February. In January the net profit was about \$3000.

COLFAX COUNTY.

At Elizabethtown, the Black Cooper mill of the Taos G. M. Co. is to have additional stamps.

Men are at work on the Reiling dredger; the machinery will weigh 300,000 pounds. The Baldy tunnel, headed for the heart of Baldy mountain—3000 feet in—is in 240 feet.

OREGON.

BAKER COUNTY.

The new boiler for the Bonanza mine is the heaviest piece of machinery that has ever arrived in the camp. It weighs 29,470 pounds.—The California mine has ordered a complete compressor plant and three drills.—The Liberty Bell mine has ordered a machine drill.—The Bald Mountain mine is installing a new light plant.—The new compressor plant for the Golconda mine has arrived and is being set up.—Butte, Mont., and Tacoma, Wash., parties have recently purchased the Sunrise mine. It adjoins the Inter-Mountain on the west.—The machinery for the Quebec's new mill has arrived.

Sumpter, March 16.

Letson Balliet says he now has final and undisputed possession of the White Swan mine at Baker City.

A 16,000-foot aerial wire ropeway now connects the North Pole mine with its mill on Silver creek; capacity 240 tons per day, estimated cost 12 cents per ton.

The 20-stamp mill of the Bald Mountain G. M. Co., Bald Mountain mine, Mammoth district, between Sumpter and Granite, is working to the satisfaction of Manager McCallum.

The smelter has resumed at Mineral City, 22 miles south of Huntington.

F. J. Circle, general superintendent J. E. Searles' Western mining interests, has issued an order closing down the Cornucopia mine until the arrival of the newly appointed receiver, Geo. D. Beatty.

The Sumpter smelter is reported sold to

J. F. Bachelder and Z. Houser of Portland.

UTAH.

JUAB COUNTY.

Mr. Earl, former Superintendent Mammoth, has an option on the Bertha group, West Tintic, in which he agrees to pay \$20,000 before thirty days. Picked samples from the new strike show 6000 ounces silver, 50% lead. The Bertha lies between the Orient and the Scotia, with the collar of its shaft 600 feet east of that on the former.

SALT LAKE COUNTY.

The Columbia M. Co., at Bingham, invite bids for their new smelting plant; F. B. Cook, manager.

At the Highland Boy, Superintendent White is putting through an average of 500 tons of ore daily, from which is derived about 40,000 pounds of bullion.

SUMMIT COUNTY.

At the Quincy mine, at Park City, D. C. McLaughlin has an ore body on the 300-foot level of which much is expected.

WASHINGTON.

FERRY COUNTY.

Jay Graves, general manager Granby, B. C., smelter, says he will build a railroad to Republic if the mine owners there will send their ores to his smelter. He offers a freight and treatment rate of \$7 per ton and to pay 95% of the value of the metals in the ores.

STEVENS COUNTY.

Supt. Morris will install drills, hoists and other machinery in the Gold Bug, near Colville.

FOREIGN.

BRITISH COLUMBIA.

Kaslo is asked to give a cash bonus of \$50,000 and exemption from taxation to a proposed smelter.

Shipments of fluxing ore from the Iron King property, near Slocan Junction, to the Hall Mines smelter, Nelson, have been discontinued. Considerable copper has been coming in the ore, which destroyed its value as a flux.

At Ymir, the Wilcox, Foghorn and Second Relief will put in stamp mills; the Arlington will put in a fifty-ton concentrating plant. A tramway will be built from the mine to the mill, 2000 feet.

Commercial Paragraphs.

THE Justinian Cairo Co. is removing its entire business from 521 Market street to the company's handsome new building just finished at 567-569 Market street, San Francisco.

THE Sullivan Machinery Co., Chicago, manufacturers of mining machinery, has purchased the business and plant of the M. C. Bullock Manufacturing Co., of the same city, taking possession on the 1st inst.

THE Broderick & Bascom Rope Co., of St. Louis, Mo., are sending to their customers a neat little advertising novelty in the shape of a celluloid stamp case with calendar and price list of their patent steel rope on the back. This should prove good advertising for this concern.

KEUFFEL & ESSER Co., of New York City, have established a branch house at No. 303 Montgomery St., San Francisco, which will carry a complete stock of their well-known drawing materials and survey instruments. The San Francisco branch will be represented by Jno. R. Carr and W. E. Holcomb.

THE American School of Correspondence, Boston, Mass., has among its instructors men who are regular teachers in several of the technical schools of Boston, with unusual advantages for teaching the theory of trades and engineering professions. Their free scholarship for engineering and mechanical drawing is a feature which attracts attention. Without leaving home or losing time from his regular work, the student pursues a course of study under the direction of instructors, papers guiding him in his work being prepared and delivered to him. Besides this, special information concerning any difficulties which may arise in their course is furnished the students.

THE Gates Iron Works, Chicago, have sold a complete copper smelting and converting plant to the Granby Mining & Smelting Co. of Grand Forks, British Columbia, this being a second order from the same concern. This order completes one of the largest copper smelting and refining plants built in the United States or Canada. The second order consists, in part, of two more water jacketed furnaces, 44"x160"; a complete ore crushing and sampling works, with No. 5 style "D" crusher, one 9"x15" Blake crusher, one "F" Gates crusher, one sample grinder, three sets of rolls, elevators, etc.; a complete silica crushing mill, including

a Dodge crusher, dry pans, rolls, elevators, etc.; one tilting reverberatory furnace complete, one converter stand complete, cars, a complete hydraulic system, blowing engine; one 10-ton electric crane and one 40-ton electric crane.

Personal.

CLARENCE KING is at Palm Beach, Florida.

JNO. FILLIUS of Redding, Cal., has gone to Boston.

A. DEL MAR is examining mining property at Randsburg, Cal.

W. J. CLARK, foreign manager General Electric Co., is in London.

EDGAR RICKARD is examining mining property at Pony, Montana.

R. B. HANLEY has been appointed receiver Sybil mine, Shasta county, Cal.

PERCY WILLIAMS succeeds P. H. Lynch as Supt. Century mill, Park City, Utah.

JNO. MITCHELL has been re-elected president United Mine Workers' Union.

W. G. DOUGLASS succeeds C. Belknap as Supt. Justice mine, Virginia, Nevada.

W. L. CLARK is now Supt. the Lowell & Arizona copper mines, Bisbee, Arizona.

W. J. CHALMERS of Fraser & Chalmers, Chicago, was in San Francisco this week.

M. R. QUEEN succeeds F. Morehouse as Supt. Utah Queen mine, Dry Canyon, Utah.

E. L. BALLOU of Shasta, Cal., takes charge of mine and mill work at Pony, Montana.

H. T. VAN F. FURMAN now fills the chair of metallurgist at the Golden, Colo., School of Mines.

THOS. M. BUZZO, manager Alice mine, has returned from San Francisco to Walkerville, Montana.

N. L. AMSTER is to be the consulting engineer of the Arizona Commercial Co. at Globe, Arizona.

F. SCHMEDER succeeds H. Ward as foreman Ralston Divide G. M. Co.'s mines, Long Canyon, Cal.

R. H. NORTON of the Oakland, Cal., Iron Works has returned from a business visit to Seattle, Wash.

V. S. GARBARINI of Amador county, Cal., goes as superintendent of a mine 30 miles from Juneau, Alaska.

ROBERT BELL has been appointed chief of the Canadian Geological Department to succeed the late Dr. Dawson.

KLONDIKE COMMISSIONER OGILVIE writes that as soon as his resignation is accepted he will visit California.

E. C. VOORHEES, Pres. California State Miners' Association, has returned from San Francisco to Sutter Creek, Cal.

F. A. C. PERRINE, formerly of Stanford, Cal., has been re-elected president Stanley Electric Co., Trenton, N. J.

W. B. MILLIKEN retires from the management of the Union Gold Extraction Co.'s mill at Florence, Colo., April 1.

CHAS. H. KRAUSE has resigned the superintendency of the Tamarack, Mich., mine to take charge of the Mass mine.

IRA FRANCIS succeeds W. J. Barrett as representative of the interests of the John A. Roebling Sons' Co. at Los Angeles, Cal.

E. O. WOLCOTT, a Colorado miner, is to be Secretary of the Interior—a fact of favorable interest to miners everywhere.

M. L. LOWREY, former foreman Angels Iron Works, Angels, Cal., is now with the Daniel Best Mfg. Co., San Leandro, Cal.

ABBOT A. HANKS has returned to San Francisco from New York, visiting several mining districts in Colorado and Utah on the way.

H. A. KELLER has returned from Australia and Chile, and is now general manager Trinity Copper Co., with headquarters at Redding, Cal.

T. H. OXNAM, M. E., has been appointed general manager Palmarejo & Mexican Gold Fields, Ltd., Zapote, Chihuahua, Mexico.

W. C. RALSTON, prominent in mining and financial legislation in the recent session of the California Legislature, has resumed active charge of his mining enterprises in Calaveras county, Cal.

THE vacant principalship of the Wilmerding Trades School, San Francisco, has been filled by the appointment of George A. Merrill, principal of the California School of Mechanical Arts. Mr. Merrill will be at the head of both schools.

REGARDING the Berliner telephone decision, Jno. I. Sabin frankly says: "I agree to have 30,000 subscribers in San Francisco at the end of this year and 40,000 at the end of next year; and further guarantee to destroy every dollar any opposition man wants to put into this field, and this without reducing a single

rate by reason of opposition. This business is an absolute monopoly. It remains to be seen whether the people want us or the other fellow."

Recently Declared Mining Dividends.

Payable.

Mammoth M. Co., Utah, 5 cents per share, \$20,000.....	March 18
Isabella G. M. Co., Colo., regular quarterly dividend, 1 cent per share, \$22,500.....	March 18
Home M. Co., Leadville, Colo., 25 cents per share, \$12,500....	March 20
Napa Con. Quicksilver M. Co., Cal., quarterly dividend, 10 cents per share.....	April 1
New Idria Quicksilver M. Co., Cal., quarterly dividend, 10 cents, and 10 cents extra.....	April 1
Modoc M. & M. Co., Pueblo, Colo., 1 cent per share, \$5000..	March 16
Gold Coin M. Co., Colo., \$30,000.	March 25
Con. Mines Co., Colo., \$10,000..	March 25
Bull Hill Con. M. Co., Colo., \$7500.....	March 25
Homestake M. Co., South Dakota, regular monthly dividend, No. 309, 25 cents, extra dividend, No. 310, 25 cents per share.....	March 25
Gwin M. Co., California, \$15,000; total, \$191,500.....	March 25
Utah M. Co., Utah, 2 cents per share, \$2000.....	March 25

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC DUMB WAITER STOP.—No. 669,266. March 5, 1901. C. W. Pierce and A. McMahon, S. F. This invention consists of a hinged rest upon the wall of the elevator well, a projection

from the cage adapted to engage the rest or stop and means carried by the cage to elevate it out of the path of movement of the cage and to hold it elevated during the desired period. There are also means for releasing the rest or stop to allow it to drop into its normal position.

HAME HOOK.—No. 669,699. March 12, 1901. Don Jackson, Pleasant Grove, Cal. This invention consists of a two-part hook having one end bent to engage the staple or fastening by which it is connected with the hame and the other with a slot and opening at one side by which the connecting link of the chain is introduced, the two turnable about the pivot pin so as to interlock and retain the chain in place and form a solid lock and brace when closed.

Trade Treatises.

Electric Locomotives for Mine Haulage, in green and silver, issued in the usual sumptuous style of the Westinghouse Electric & Mfg. Co., Pittsburg; replete with such practical information as would naturally be desired by a miner on that subject.

Bulletin No. 1004, from the Denver Engineering Works Co., Denver, Colo., describing the improved Cammett concentrator, illustrated by half-tone engravings, showing the concentrator in its various parts, and giving a clear idea of its construction. Complete dimensioned drawings of both table and counter shaft are also given, together with general data,

so that any one designing a mill, and desiring to show a Cammett table in the plans, can find all necessary information. The most noticeable improvements which have been made recently on the concentrator are the simple and efficient head motion and the pulp distributing box. The bulletin includes working drawings of classifier, with the dimensions of various sizes conveniently tabulated. It also includes a classified list of the more important minerals, together with their specific gravities, which will be found a useful reference for men engaged in ore concentration. This bulletin will be forwarded on application to the Denver Engineering Works Co., 30th and Blake Sts., Denver, Colo.

Publications Received.

"Metal Statistics" is the title of an unusually elaborate and concise series of tables containing prices, stocks, production and supply of copper, tin, lead, spelter, aluminum and iron, embracing a period of nearly fifty years, arranged in a simple but comprehensive form. It contains twelve pages, large folio size, paper cover, and is issued by the Report Company, 61 Beekman street, New York City; price \$1 per copy.

Latest Market Reports.

SAN FRANCISCO, March 21, 1901.

SILVER.—Per oz., Troy: London, 28¹/₂d (standard ounce, 925 fine); New York, bar silver, 60¹/₂c (1000 fine); San Francisco, 60¹/₂c; Mexican dollars, 50c San Francisco, 49c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.50; Casting, 1 to 3 casks, \$16.65; carload lots, \$16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £69 per ton, equivalent to a net price of 14.9c per pound, the lowest since January, 1900, when copper was selling in London at £69 2s 6d and in New York Lake was selling at 16 cents per pound. Since January 1 London value of G. M. B. copper has fallen £5 10s per ton, or about \$1.10 per 100 pounds. In the domestic market prices have not varied over 1 cent. The London decline is not due to pressure to sell or to bear attacks, but to absence of demand and lack of support from American buyers, who had held the market at a fixed level.

LEAD.—New York, \$4.37¹/₂; Salt Lake City, \$4.00; St. Louis, \$4.20; San Francisco \$5.00, carload lots; 5¹/₂c 1000 to 4000 lbs.; pipe 6¹/₂, sheet 7¹/₂, bar 6c; pig, \$4.70 @5.10. London, £13 2s 6d per ton=2.85 cents per lb.

SPELTER.—New York, \$4.00; St. Louis, \$3.50; London, £17 per ton=3.7 cts. per lb; San Francisco, ton lots, 5¹/₂c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9¹/₂c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, \$15.00;

gray forge, \$14.25; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$21.75; open hearth billets, \$25.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.50; San Francisco, ton lots, 29c; 1000 lbs., 29c; 500 lbs., 29c; less, 30c; bar tin, \$ d., 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 7½ lbs.; Export, \$45.00

MAGNESIUM.—New York, \$2.90 \$ d.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15c.

ASSAY LITHARGE.—San Francisco, 10c \$ d., small lots.

BISMUTH.—New York, \$ d., \$2.25 50-lb. lots; San Francisco, \$2.50 to \$2.75 \$ d. lots.

PLATINUM.—San Francisco, crude, \$17 \$ oz.; New York, \$18.20 per Troy oz.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, \$ d., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 85c (60%).

NICKEL.—New York, 50¢@60¢ \$ d.

PHOSPHORUS.—F. o. b. New York 50¢@60¢ \$ d.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15c; less than one ton, 17c. No. 1*, 60%, carload lots, 13c; less than one ton, 15c. No. 1** 50%, carload lots, 11c; less than one ton, 13c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9c; less than one ton, 11c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65;

Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c \$ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 32½¢@33½¢ \$ d.; carloads, 30¢@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66¢ B, 2c \$ d.; soda ash, \$1.90 \$ 100 lbs. 58%; hyposulphite of soda, 2½¢@3c \$ d.; blue vitriol, 5½¢@6c \$ d.; borax, concentrated, 7¢@8c \$ d.; chlorate of potash, 12¢@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½¢@2c; California refined, 1½¢@2c; nitric acid, in carboys, 8c \$ d.; caustic soda, in drums, 3¢@4c \$ d.; Cal. s. soda, bbls., \$1.00; sks, 95c \$ 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

WANTED.

WANTED.—A COMPETENT MAN TO TAKE charge of a 40-ton copper smelting furnace in Arizona, with a company that affords opportunity for advancement. Address, stating experience had and salary required, ELIOT, this office.

Wanted—Rand Drill Man.

Must be capable of running compressor. State experience and wages required. One acquainted with Mexico and language preferred. Address DRILL, care of Mining and Scientific Press.

WANTED—Belt Driven Air Compressor.

Address, giving particulars, B. A. C., this office.

WANTED.

A THOROUGH, UP-TO-DATE ASSAYER.—A technical graduate, competent to keep mine books, not over 25 years of age, good health, not afraid of work, must write a good hand, be accurate at figures, good habits, must furnish A1 references. Pay, \$2.50 per day; board, \$2.00 per month. One of pleasantest situated mines in California. Chance for advancement to assistant manager to the right man. Address Box 27, care this paper.

BRITISH COLUMBIA MINES.

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investments in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale; terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew F. Rosenberger, P. O. Box 700, Nelson, B. C.

SITUATIONS WANTED.

A practical, experienced Cyanider, Assayer and Chemist, familiar with general mill work, desires a position. References furnished. Address Cyanider, care this office.

A Mining Engineer with many years' experience as a manager of large properties in the United States and Mexico, is open to an engagement as manager or superintendent. Possesses both executive and managerial ability and can furnish the best of testimonials. Address Box 29, care of this office.

TO GOLD DREDGING COMPANIES.

A mining and electrical engineer, with six years' experience at successful gold dredging, is desirous of obtaining a position as superintendent with a dredging company. Can design machinery to suit any conditions. Address "Gold Dredge," this office.

ABOUT May 10, a young man wishes position as assayer or assistant assayer and surveyor; has had practical experience, including cyanide work, with college training; wider experience desired; moderate pay with chance for advancement; references. Address "Gabbro," this office.

Expert Cyanider and Matte Smelter, experienced in quartz mining, milling, chlorination (O K chemist and assayer), wants to take charge of or design plant, develop or report on (incl. survey) property. Would accept temporarily subordinate position as shift, mill, or furnace boss, or in laboratory, till advanced. All references. "Practical," this office.

WANTED.—A POSITION AS AN ASSAYER and General Assistant, if desired. Ten years' experience in general mining. Two years managing mines in Mexico. Practical knowledge of language. Address Box 25, care of this paper.

Situation Wanted by Mining Engineer of 20 years' experience in California, Colorado, Mexico and Germany. Had charge of large properties—gold, silver, lead, copper, sulphur and oil. College graduate; good assayer, surveyor and accountant; speaks Spanish. Has experience in railroad construction and road building. Formerly U. S. deputy mineral surveyor and member of geological field force. Will go anywhere. Address P. M., Mining and Scientific Press.

Position as Superintendent

of a gold mine or mill desired by an experienced mining engineer and metallurgist. Competent to take full charge of a gold mine or mill. Technical graduate. Good assayer, surveyor, etc. Can leave present position on short notice. Salary moderate. Address "B. Sc.," care of this paper.

Engineers, Firemen, Machinists, Electricians:

Send 10 cents for new 40-page pamphlet containing list of questions asked by examining Board of Engineers. GEO. A. ZELLER, Publisher, St. Louis, Mo.

The Reward of Merit.

The fact that we are the largest manufacturers of oil filters in the world is but a fitting tribute to the true merit of the filter.

Cross Oil Filter.

An oil filter that saves half your oil bills, an oil filter that filters and filters right. Each and every filter that leaves our factory gives the same universal satisfaction. Shall we send one on approval, to be returned at our expense if not satisfactory?

THE BURT MFG. CO.,
Akron, Ohio, U. S. A.
Largest Mfrs. of Oil Filters in the World.
We also manufacture the BURT EXHAUST HEAD.

Annual Meeting.

The Regular Annual Meeting of the Stockholders of the CHAMPION MINING CO. will be held at the office of the Company, 113-114 Crocker Building, San Francisco, California, on TUESDAY, the 8th day of April, 1901, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on SATURDAY, March 30, 1901, at 12 o'clock noon.

B. N. SHOENRIFT, Secretary.

Office—113-114 Crocker Building, San Francisco, California.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

WE CARRY FULL LINE OF ABOVE GOODS.

FOR SALE.

FOR SALE.

A Large Group of Silver-Lead Properties in British Columbia.

18 Months' Bond. Easy Payments.

Five Separate Leads, All Carrying Ore.

For assays and other particulars, write **HOPE, GRAVELEY & CO., 536 Hastings St., Vancouver, British Columbia.**

MACHINERY.

THE S. H. SUPPLY CO.,

22d and Larimer Streets,
DENVER, COLORADO.

The Largest Machinery Depot in the West.

We shall be pleased to send you complete specifications of the following. This is only a partial list; send for complete list No. 41.

BOILERS.

- 2 100 H. P. HEINE WATER TUBE.
- 2 100 H. P. TUBULAR.
- 2 85 H. P. TUBULAR.
- 4 40 H. P. TUBULAR.
- 1 35 H. P. TUBULAR.
- 20 SMALLER VERTICAL BOILERS.

ENGINES.

- 2 18x49 FRASER & CHALMERS CORLISS.
- 1 18x33 BASS CORLISS.
- 14x20 ATLAS AUTOMATIC.
- 12x18 SKINNER SLIDE VALVE.
- 10x15 HENDEY & MEYER AUTOMATIC.
- 9x12 PAYNE AUTOMATIC.
- 7x10 MCINTYRE HIGH SPEED.
- 25, 20, 15, 10, 8, 6 H. P. SLIDE VALVE ENGINES.

GASOLINE ENGINES.

- 15, 12, 10, 4 and 3 H. P. GASOLINE ENGINES.

PUMPS.

- 12x8x10 and 6x4x6 WORTHINGTON DUPLEX.
- 12x12x12 DAVIDSON SINGLE.
- 7x4x10 DAVIDSON, 10x5x12 SMITH-VAILE.
- 12x7x12 MARSH, 6x4x6 KNOWLES.
- 90 BOILER FEED PUMPS.
- FRENIER'S SPIRAL PUMP.

MILLING MACHINERY.

- 20 850-LB. RAPID DROP STAMPS.
- 14 AMALGAMATING PANS.
- 11 SETTLERS.
- 3 CLEANUP PANS.
- 10 AMALGAM SAFES.
- 2 AMALGAM CARS.
- 12 QUICK ELEVATORS.
- 14 WILFLEY TABLES.
- 7 BLAKE AND DODGE CRUSHERS.
- 3 SET F. & C. 30x10 ROLLS.
- 1 SET CORNISH ROLLS.
- 5 PEBBLE PULVERIZERS.
- 1 40-TON BANCROFT PULVERIZER.
- 1 GRIFFIN MILL.
- 15-FOOT HUNTINGTON MILL.
- 2 HARTZ JIGS, DOUBLE.

ROASTING MACHINERY.

- 60 IN. x 27 FT. HOWELL IMPROVED WHITE.
- PIERCE ROASTING FURNACE.
- 3 REVOLVING ORE DRYERS, 18-FOOT.
- 4 RETORTS AND BULLION FURNACES.

MISCELLANEOUS.

Thousands of feet of RUBBER AND LEATHER BELTING, taken from the mills which we dismantle.

Hundreds of tons of SHAFITING, that for use is as good as new.

1500 of all sizes of PULLEYS, both wood and iron.

BOXES, HANGERS, COLLARS, COUPLINGS. SECOND-HAND PIPE that has all been carefully rethreaded and guaranteed to be free from holes or splits.

All sizes of VALVES, and large quantities of BRASS GOODS of all kinds.

Our new catalogue is now issued and contains a large amount of information in regard to slightly used machinery and supplies.

All prices are put in plain figures. No discounts.

THE S. H. SUPPLY CO.,

The Largest Depot for Slightly Used Mining and Milling Machinery in the World,

22d and Larimer Streets, DENVER, COLO.

FOR SALE OR LEASE.

THE MOHAWK GOLD MINE,

PINAL COUNTY, ARIZONA, about 50 miles north from Tucson. For particulars, address N. B. ALLYN, Gale's Ferry, Conn.

FOR SALE.

ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Bannack, Mont. For full particulars, address **THE BUCYRUS COMPANY, South Milwaukee, Wis.**

MACHINERY BARGAINS.

I have some splendid Air Compressors, Hoisting Engines, Rock Drills, Rock Crushers, Channeling Machines, Steam Pumps, Boilers, Steam Shovels, Locomotives and Relaying Rails, all in splendid condition. Send for printed list and specify your requirements. I can save you money.

WILLIS SHAW,

627 New York Life Bldg., CHICAGO.

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

SOLAR HOUSE LIGHTS

Costs **\$4.00** Per Light

EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Burns all town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.

Write us for particulars.

SALE.

Six FIVE FOOT Huntington Mills

TOGETHER WITH NECESSARY

CRUSHING AND POWER PLANT.

Will Be Sold as Separate Items or Entire Mill.

PRESENT LOCATION: NEAR DEADWOOD, SOUTH DAKOTA.

Used Less Than Three Months. Guaranteed in Splendid Condition.

WILL NAME PRICES F. O. B. DEADWOOD, CHICAGO, OR DELIVERED AS DESIRED.

SPECIFICATIONS (Condensed).

- 6 ORE GATES, 24 x 38, rack, hand wheel, frames, bolts, complete.
- 2 ORE BINS, all necessary bolts, rods, nuts and washers.
- 2 GRIZZLEYS, 4' x 10', 1" openings.
- 6 CHALLENGE AUTOMATIC ORE FEEDERS, including hoppers, wood frame, shafts and pulleys.
- 6 HUNTINGTON CENTRIFUGAL ROLLER MILLS, 5' diameter, all fixtures and fittings, complete with wooden frame, shafts, pulleys and gearing.
- 6 COPPER TABLES, 6' x 12', 1/2" copper, electroplated 1 oz. of silver per square foot.
- 2 AMALGAM SAFES.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for main belt.
- 1 BELT TIGHTENER, complete with pulley, boxes, etc., for crusher.
- 1 CORLISS ENGINE, built by Fraser & Chalmers, cylinder 20" diameter by 48" stroke, complete in every particular, shaft 10" in diameter, band flywheel 16' diameter, 30" face; weight, 42,000 pounds.
- 3 HORIZONTAL TUBULAR BOILERS, 54" diameter, 16' long, complete with steam drums 30" x 72", mud drums 18" x 66" for each boiler, breechings, smoke box, stack 48" diameter 60' long, all necessary guy rope, half arch fronts, grate bars, cast and wrought iron parts necessary for setting, feed, blow off check and safety valves, gauges and all fittings. Weight, 51,000 lbs. At present these boilers are arranged for setting in one battery. We will make any changes required, furnishing stacks and other items necessary to set each boiler separately.
- 1 HEATER, tubular, 30" diameter, complete, with exhaust pipe.
- 2 NO. 5 KNOWLES BOILER FEED PUMPS.
- 1 BERRYMAN HEATER, 18" diameter by 7' long, copper tubes, 4" pipe inlet and outlet.
- 1 HOOKER VERTICAL SINKING PUMP, 14x8x14, 6" suction 5" discharge.
- 8 ORE CARS, one ton capacity each.
- 1 WATER WHEEL, 50 H. P.
- 1 16" BULLION FURNACE, complete, including 10" Gold Retort, stack and all iron work.
- 1 NO. 5 STYLE B GATES FINE CRUSHER.
- 1 LOT REPAIR PARTS FOR HUNTINGTON MILLS, including roller shells, ring dies, scraper bars, shoes, screens, clamping plates, all new, never used.
- 1 LARGE LOT OF PIPE AND FITTINGS.
- 1 LOT BOLTS, WASHERS, RIVETS AND NUTS.
- 1 LOT OF MISCELLANEOUS SHAFITING, PULLEYS, PILLOW BLOCKS, HANGERS, ETC.

"THE DANIEL BEST" 50 Horse Power TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.  
Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,  
San Leandro, California.

## THE COMMON SENSE WHIM

Is made of the best wrought iron and steel. Compact and light; can be conveniently moved, carried by pack animals anywhere. If accident occurs the deadlock saves the load. : :

## SINKING PUMPS,

Indispensable in sinking mining shafts or pumping out flooded mines. Easily raised or lowered by cable or rope. Equipped with outside packed plungers. Handles gritty or dirty water. Operates bolted to shaft timbers or only suspended by cable at any angle. Packing glands external. May be adjusted while in motion. Removable parts hinged. Steam movement positive and simple.

100 POUNDS OF ORE SAMPLED IN 10 MINUTES.

## Calkins' Umpire Ore Sampler.

An accurate, quick and absolutely impartial machine for sampling ore in quantities of from

one to one hundred pounds. Easily operated and cleaned. No danger of salting subsequent samples. Makes the operation of sampling an easy one; and all competent assayers know that to obtain an assay sample by hand requires more trouble and time than is necessary to reduce the resultant sample to the pulp. Diagonally opposite portions are taken each time; and assay samples are obtained with this machine in less time and with less trouble than by any other method.

Established 1860.

DENVER, COLO., U. S. A.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## A Substantial Roofing==

P. & B. Ready Roofing is not a paper roofing, but a strong, closely woven jute canvas, thoroughly saturated and coated with P. & B. Compound, and lined with heavy felt paper. It is ten times stronger than any paper, felt or other ready roofings. It cannot be torn; is fire resisting, waterproof and perfectly odorless. It is one-eighth of an inch thick, light in weight, doesn't require heavy support and can be laid by anyone without difficulty. Comes in rolls—portable and cheaply transported. It is not injured or affected by heat, cold, moisture, fumes, smoke, acids or gases, and outlasts tin, iron, slate, shingles and tar.

Send for booklet. Address Department A.

# CATES IRON WORKS

## MINING MACHINERY.

Among Our Great Specialties Are:

### HOISTS.

This is a type of a very strong, well-designed machine, single or double drum.

### SMELTING FURNACES.

Our furnace line includes Lead, Copper, Round, Rectangular, Reverberatory, Cupelling, Wrought Iron, Cast Iron, and all accessories.

### BRUCKNER ROASTERS.

In this line we have equipped some of the most important plants. We furnish all the accessories of a complete installation.

### CONVERTERS.

This specialty is strictly up-to-date, with every possible feature of a perfect plant. We have introduced some very important features in copper converter installations.

### IRON JIGS.

We take special pride in directing attention to a first-class jig shown in this cut.

### TILTING CRADLES.

This small cut will give an idea of the construction of this machine. All the cuts in this ad, made direct from the originals on our shop floors.

## THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/2" wide by 1 1/4" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : S. K. SNODGRASS, Denver, Colo. (The Windsor.)

"A PROPHET IS NOT WITHOUT HONOR SAVE IN HIS OWN COUNTRY," but

# THE LEYNER AIR COMPRESSORS

are most used where they are best known.

IN COLORADO, for illustration, they are used in the following MINES, MILLS, SMELTERS and MANUFACTORIES:

PACKED FOR MOVING.

**NO WATER NEEDED.**

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

**THE PNEUMATIC SEPARATOR.**

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

Operator taking courses or horizontal  
 angles with BRUNTON'S PAT. POK-  
 ET MINE TRANSIT.  
 If you wished to find the angle be-  
 tween two points below the horizontal  
 with a sighting compass or an ordinary  
 transit, you would first have to set up  
 your tripod or staff and then level up  
 your instrument. All this takes time.  
 If you only wanted to get the angle  
 within a degree or so, you could take  
 a BRUNTON TRANSIT, and holding it  
 in the position shown, take your  
 readings in less time than you can  
 take any other instrument. Send for  
 descriptive catalogue B to

No. 044 BUTTON BALANCE. Sensitivity 1-100 milligramme.  
 If you are in the market for the very best balance obtainable at  
 a moderate price, write us for particulars about the No. 044. You  
 will be surprised to find how cheaply it can be purchased for  
 cash. While we cannot recommend this balance for fine gold  
 work, a great many assayers are using it for such successfully.  
 Send for illustrated catalogue A, for complete description and  
 prices, to

**Don't Take Chances**

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore.  
OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tail-  
ings, and our record of results—showing in almost every instance achievements on the large scale such  
as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a  
Specialty of

**CYANIDE WORK**

and claim to have introduced the use of Cyanide to this Western country by the

**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes:  
our experts, however, are constantly devising improvements, the latest being a method of overcoming  
the difficulties which have hitherto prevented the successful handling of ores containing copper and  
also a method for the profitable handling of silver ores by cyanide.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced  
first-class agency. We have able and trustworthy associates and agents in Washington and the capi-  
tal cities of the principal nations of the world. In connection with our scientific and Patent Law Li-  
brary, and record of original cases in our office, we have other advantages far beyond those which can  
be offered home inventors by other agencies. The information accumulated through long and careful  
practice before the Office, and the frequent examination of patents already granted, for the purpose of  
determining the patentability of inventions brought before us, enables us to give advice which will  
save inventors the expense of applying for patents upon inventions which are not new. Circulars and  
advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market  
St., San Francisco, Cal.

OREGON

# THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.: "We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:  
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:  
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:  
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

Is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

NEW YORK OFFICE, 121 LIBERTY ST.

WORKS, NEW HAVEN, CONN.

## The Lunkenheimer Automatic Injector

For All Classes of Steam Boilers.

Well designed, compact, efficient, durable, low priced and reliable. In action it is easy to start, has large range of work, full capacity, is absolutely Automatic and the discharge can be graded within wide limits. All parts are well proportioned, strong and durable, and any worn-out piece can be easily and quickly replaced at slight expense. Starts low at 22 lbs., works high to 185 lbs. Feed water 76 degrees, lift 3 feet, works without adjustment of steam or water at pressures from 60 to 180 lbs. Automatically restarts if operation is temporarily interrupted. Tubes are easily removable for examination and repairs by the simple use of a common wrench. Devoid of small parts which are easily lost or unreliable in action. Fifty per cent more durable than any other machine of its class. Retains original efficiency under constant usage and slight wear on tubes will not impair its operation. Works well with hot feed water and on long lifts. Impartial tests solicited and satisfaction guaranteed. Specify the Lunkenheimer Automatic Injector and order from your dealer. Send for descriptive circular and catalog of engineering appliances of superior quality.

## ASSESSMENT NOTICES.

**LARKIN MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 13th day of March, 1901, an assessment (No. 10) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of April, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
N. P. REMINGTON, Secretary.  
Office—112 Main street, San Francisco, California.

**MARIPOSA COMMERCIAL AND MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of February, 1901, an assessment (No. 21) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 4th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
JOSEPH H. MOOSER, Secretary.  
Office—320 Sansome street, room 24, San Francisco, California.

## DELINQUENT SALE NOTICE.

**YUBA RIVER GOLD DREDGING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Smartsville, Yuba County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 2) levied on the 4th day of January, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

**HERCULES** stands for the best,  
for the most improved — Gasoline Engine.  
Special attention given to hoists and mill engines  
for mines. 2½ to 400 H. P. New catalogue  
Jan. 1st.

HERCULES GAS ENGINE WORKS,

141-143 First St., San Francisco, Cal.

## POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.  
Send us your inquiries.

# THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY.

SUTTER CREEK, AMADOR Co., CAL., Feb. 22, 1897.

Yours truly, JOHN ROSS JR., Superintendent.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

Yours truly, EUGENE MAY, Foreman.

For any information regarding Frue Vanner or Belts, call on or address

## In the Black Hills.

To the right of these lines is a good portrayal of the general appearance of the D. & D. Smelter at Deadwood, Lawrence county, South Dakota, a prominent institution in the commercial center of the Black Hills mining region. The only flux not found in the Black Hills is copper ore, now shipped from Butte, Mont., though from recent reports sufficient copper ore will be shortly forthcoming nearer home, the Montezuma mine at Deadwood now furnishing iron ore and a little copper.

In the Central Hills, in Pennington county, is the Holy Terror mine, in Keystone district, being to that section what the Homestake is to the Northern Hills. In the lower left-hand corner of this page is a representation of the stamp mill of that mine at Keystone. The mine is a steady dividend payer; the ore is partly free-milling, partly sulphides, the company now experimenting with the cyanide process. What is known as the Keystone belt of ore is considered the largest and best defined in the Black Hills. The B. & M. R. R. Co. has built a spur line from Hill City to Keystone, cutting through this ore belt. From the Southern Hills, in Custer county, comes this week a statement that tin in paying quantities has been discovered at the mica mine of Dows & Co.

D. & D. Smelter at Deadwood, South Dakota.

## U. S. Mining Law Amendment.

The Senate committee on mines and mining, to whom was referred the bill to amend the mining laws of the United States, have reported it back with an amendment in the nature of a substitute. They argue that the intent and meaning of the mining laws have been wholly disregarded in locating placer mining claims in Alaska and in the attempted location of oil lands in California. In Alaska single individuals, by means of powers of attorney and other devices, monopolize vast tracts of mineral lands upon which no labor is performed, thus greatly retarding development of the country and depriving bona fide miners of the opportunity to explore and develop mines and obtain title. The bill reported by the committee re-

peals all laws allowing one person to locate for another, and requires \$100 worth of development work upon each location within a year from the date thereof, and on all claims heretofore located it requires the development work to be done before the 1st day of October, 1901, and in every year thereafter.

In California a few persons have attempted to locate hundreds of thousands of acres of petroleum or oil lands under the placer mining laws; and petroleum discoveries have only been made or attempted on a very small percentage of these claims. The existing placer mining laws, which the courts and the general land office hold to require an actual discovery of mineral or petroleum as the very basis of a placer mining loca-

tion, are not adapted to the acquisition of petroleum lands, owing to the fact that petroleum, unlike placer gold, is rarely found upon or near the surface, and can only be discovered by expensive drilling operations. Hence these laws do not apply or give rights to the prospector prior to an actual discovery of oil during the time necessarily consumed in drilling discovery wells. As the claimant acquires no right by the mere attempted location, prior to an actual discovery of mineral or oil, his claim is subject to exploration by any rival claimant, and the first to discover mineral or oil will acquire the better title, regardless of the priority of attempted locations. It is therefore clear that lands supposed to be valuable for oil, but upon which no oil has been discovered, are open to acquisition under the agricultural land laws; but these laws are not alone adequate to meet the situation, as such scrip, land warrants, and forest-reserve lands, with which supposed oil lands may be acquired, are limited in quantity and held by private parties, and therefore not readily obtainable. In view of these considerations, the committee believes that the placer mining laws are not applicable to lands supposed or believed to contain petroleum, but upon which no discoveries have been made. The practice of using those laws to monopolize large areas of land, without title and without assurance of protection to those exploring and investing thereunder, operates to retard rather than to advance the development of the oil resources of the country, and leads to strife and contention. The committee believes that an opportunity should be given to purchase from the Government such lands, in limited quantities, to those who make affidavit that the same is believed to be valuable for petroleum. The bill which the committee presented is intended to permit this without interfering with the right to acquire under the placer mining laws lands upon which oil discoveries have actually been made, as it is only to such lands that the existing law is applicable. The committee's bill gives the privilege of purchasing lands which are believed but are not known to contain oil, in tracts of from 10 to 160 acres, at \$2.50 per acre.

Parting Assays; Mining and Metallurgical Patents, 159. Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Commercial Paragraphs; Recently Declared Mining Dividends; Obituary, 163.

In a Colorado mining suit, on July 27, 1900, the Commissioner of the General Land Office decided that, in locating a mining claim, the lines or stakes could not be put on patented ground by the applicant. From this decision appeal was made to the Secretary of the Interior, who now reverses the decision of the commissioner and says: "Any of the location lines of a lode claim may, if established openly and peaceably, be laid within, upon or across the surface of patented lode mining claims for the purpose of embracing and including the discovery vein and all other veins apexing within the free and unappropriated ground within such location lines, and the ground itself as well, and of defining and securing extralateral underground rights upon all such veins."

In admiring the great things now being done on so large a scale in the mining world there is in some cases insufficient attention given to the needs of the small mines, the necessity for a method of treatment of ores so that the owner of a little mine can have as much proportional opportunity to profit by improved economical processes as the owners of large properties have. The tendency of much of the present mining literature is to convey the idea that no one can run a mine any more unless he turn it over to a big combination; that the era of trusts and combines takes in the mining industry as well as everything else. This is not a good idea to have prevail. The ocean, bays and rivers could not exist without the little rills and feeders, and the day that the prospector and small miner gets it fairly in his head that he can't do anything unless he has access to a half million dollars will be a bad day for the mine combine or trusts of any size. The tendency of the times is to inculcate the idea in the prospector's and miner's mind that as soon as he has found mineral in place, or demonstrated that a mine can be made, that he must immediately step aside and let others make it. It is just as needful as ever that the miner shall be resourceful, shall be able to secure the necessary requirements to work his property on a small scale as a large one, and if this be available the number of producing mines will increase; if it be unavailable, then the number will diminish. Far be it from any one to decry or deny the grand advance in economical mine management and the manipulation of mine products on a great scale in a cheaper way with commensurate profit, but it is not business to push to its ultimate conclusion the idea that all that is left to the prospector or miner is the rudimentary discovery of the "prospect," and that he is to be relieved of all trouble as to transportation or treatment.

## Varying Conditions.

In the issue of the 2nd ult. was an editorial article, "Barren Zones," in which, after discussion of what a "barren zone" is, it was stated that nerve and money had demonstrated the existence of paying ore bodies below such barren zones.

That is not, however, to be considered as an infallible rule, or unvarying condition. In this, as in all other things relating to mining, local conditions and circumstances govern the case.

The subject has practical illustration in the case of the Drum Lummon mine, Marysville, Montana, once a great property and a big dividend payer. Its present owners, the Montana Mining Co., held a meeting in London on the 12th inst., at which time Manager Burrell made personal report to the directors of the last half year's operations in 1900.

From the first discovery to the year 1886 the ore from the surface to the 400-foot level was high grade; below that level the ore bodies decreased in size and value of ore, and below the 800-foot level several of the ore shoots gave out. A few small bodies of low-grade ore held on to the 1000-foot level, but below that the little ore that was found did not pay for treatment.

At this point the late Prof. Clayton was called upon for an expert opinion, his advice being that below the "barren zone" the vein might again become productive. It was, therefore, determined to sink 600 feet deeper, and this has been done, with barren result. There has been also additional development work from that 1600-foot level—crosscuts, drifts and upraises aggregating 5000 feet—with nothing to indicate that the "barren zone," which has been proven to extend from the 800-foot to the 1600-foot level, may not extend to farther indefinite depth. Accordingly, having expended in the six months ending December 31, 1900, \$51,482.33 in such development work on the 1600-foot level, with such discouraging result, the directors have called a halt, to take counsel as to what they had best do—continue sinking or quit.

The directors emphatically assert their belief that it is money thrown away to continue further exploration in that part of the mine, and say that should the majority of the shareholders determine to continue such exploration they (the directors) "are not disposed to associate themselves with such a policy." This belief of the directors is shared by the resident manager.

This particular mine and its present condition is merely referred to as affording a practical object lesson and an interesting exposition of the whole subject of barren zones, and forms a case in point. It is probable that the opinion of the directors and the manager will prevail, and that the work of exploitation for resumption of ore below the "barren zone" shall stop. In such case the question remains an open one, though from the zeal and thoroughness with which the work has been done there is good ground for the negative argument of the directors. But, as in all such cases, it proves nothing; it neither strengthens nor weakens the main general question, and affords no means of judgment for action in a mine that might adjoin it.

The report shows profitable operation of other parts of the mine during the six months indicated, there having been extracted from the upper levels 7301 tons ore, yielding in bullion bars and concentrates \$66,289.75, an average of \$8.50 per ton. Mining and milling expenditures in connection therewith were \$53,899.90, an average of \$6.91 per ton. During the same time 72,518 tons tailings were cyanided, producing \$195,544.57, an average of \$2.70 per ton. The total treatment, including redemption of cost of the cyanide plant, aggregated \$99,275.31, being \$1.37 per ton, a net profit in that part of the mine work of \$96,296.26, or \$1.33 per ton.

In Calaveras Co., Cal., the Gwin mine, with an ore shoot over 1300 feet long, a steady dividend payer, was shut down; low-grade ore only was produced for the first 400 feet. Between the 400 and 900 foot levels \$10 ore was found. The mine paid about \$2,000,000 in dividends before being shut down. Plucky California miners with two requisites for every miner—"nerve" and money—spent about \$250,000 in further exploitation of the mine, with the result that for several years past the Gwin is one of the regular dividend payers of the State. The Kennedy

mine, in Amador Co., Cal., the deepest worked of any mine in California, was sunk and explored to a depth of 600 feet, and shut down because the ore was of too low grade to pay. Like the Gwin, men who had faith went ahead, for, as in religion, so in mining, "faith without works is dead," and made the Kennedy famous. Last week in this column was chronicled the finding of rich ore in the Kennedy, at a point 3000 feet below the croppings. One more California case may be cited—the Eureka, Sutter Creek, Amador Co., Cal.—where the first 400 feet gave ore assaying \$2.50 per ton. Subsequent workings to the 1200-foot level gave an output of \$15,000,000.

It is to be said in general that every pay ledge has barren places, and every mine, great or small, has barren zones. In the natural forces that created the mountains it is reasonable to assume that pay ore and barren quartz were alike upheaved.

THE homely art of grubstaking and the co-operative method of mining should not be overlooked in all the current talk of great schemes and big things. It is not vouchsafed to everybody to be in on a million-dollar deal, nor is it always desirable; but in a small way as a safe proposition it can always be recommended to everybody, resident and non-resident, in mining localities that the business of mining can be done without much risk or parade. There is getting to be too much attention given to the big things and not enough devoted to the minor enterprises, and, after all, it is these smaller projects that maintain the mining industry and keep up attendant industries. Where people know their men it is always in order to form co-operative effort in the way of prospecting and developing. There are few places that can not afford, say, ten men who could weekly put up \$5 each for a prospecting fund and keep, say, two prospectors in the field. The \$50 a week would be sufficient, for if they are real prospectors the two men out would want no more than their expenses and would be willing to take pro rata interest in the probable discoveries as part pay. When these prospectors have a good prospect it would be then in order to furnish them sufficient money to partially develop it and see if it were worth being made into a mine. If it so showed, that would be about the time to have some one who knew more about it than the ordinary man give expert opinion thereon as to whether the claim should be given further development, which would involve the purchase of a little machinery and more outlay. It might be that a sale or bonding would be more satisfactory. Without any outlay for offices or top heavy expenditure a comparatively small amount could be made to do a good deal in the way suggested, and it is in that way that some of the biggest mines in the country to-day were first called into being.

In an attempt to sell a prospect the simplicity of truthfulness is sometimes not given its just value. In trying to interest capital the owner of a prospect will best serve his own interests by stating the exact facts as he knows them, and let the investor do all the theorizing. The truth is usually good enough, and helps those who stick to it. Rarely does a prospector aid his cause by misrepresentation of anything in connection with his claim. And no investor ever examined a claim which he found to have been willfully misrepresented who did not go away with a bad opinion of that whole district.

WORTHLESS and fraudulent schemes are being presented to miners everywhere of small portable smelters "guaranteed" to do wonderful things, greatly to the loss of any one credulous enough to believe what those lying circulars say. The matter is again referred to here as illustrative of the fact that there is a constant need and demand for small smelting and machinery plants, and it is the knowledge of this that makes such fellows as Hartsfeldt so successful in working off their worthless productions.

CONSIDERABLE in the way of mining evolution has been done in the Black Hills, and the economy of modern mining methods finds full expression in that region. At the Deadwood-Tierra mine a 160-stamp mill has crushed 15,000 tons of ore per month, averaging \$1.80 per ton, at a total cost for mining and milling of \$1.40 per ton.

## Concentrates.

ABOUT 3900 California mining properties have been surveyed for patent.

A BRAZING SOLDER for copper, iron or brass is made of equal parts of copper and zinc melted together.

THE Temescal, Cal., tin mine produced 143,400 pounds tin during 1892. It has not been worked since that year.

THE limit of distance to which the sound of the voice can be distinctly conveyed in a straight pipe is about 1700 feet.

AN injector forces water into a boiler because the area of the steam nozzle is greater than the area of the combining tube.

A PROCESS to use liquefied air in cyanide treatment was patented about eighteen months ago, but nothing practical has come of it.

THE specimen from Chloride, Arizona, is cerussite, a rare form of lead ore in the form of small white needles, slightly resembling asbestos.

SO LONG as China and India exist there will always be "a future for silver," and it is not likely that its price will fall far below present quotations.

AT an elevation of 9000 feet above sea level the barometer indicates 21.22 inches, and the efficiency of an air compressor would be 75% of that at sea level.

IN 1897 the cost of mining, freight and treatment of ore from Republic, Wash., was nearly \$40 per ton. Ore at that camp can now be treated for \$10 per ton.

THE Arizona Supreme Court last week decided that no lien shall hold against a leased mining property in that Territory for indebtedness incurred by the lessee.

IN 1886 but 58% of the New York value of entire contents of one ton of ore was paid the Utah miner by silver-lead smelters; in 1897, 62.6%; in 1901, about 69%.

IN the borax mines of Daggett, San Bernardino Co., Cal., the deposit is borate of lime, not in the crystalline form, but as a mud shale, containing about 10% boracic acid.

TURQUOISE of varying quality is produced in northern Arizona. From mines near Silver City, New Mexico, comes nearly 5% of the world's present supply of that gem.

GROUND GLASS is deemed an excellent flux for cyanide slimes. The charge for melting is fifty pounds white glass and fifty pounds borax to each 100 pounds of roasted slimes treated.

THE new law passed by the Colorado Legislature gives tunnel companies in that State the right of way through mining claims, the owners of the latter being protected in their rights.

COBALT is found in California 2 miles north of Cisco, Placer county, cobaltine, a silvery white mineral with reddish tinge, occurring as impregnation in a mica schist near the granite contact.

IN the State of Nevada to hold a mining location, within ninety days after the posting of the notice, the locator must sink a discovery shaft to a depth of at least 10 feet, or run a cut or tunnel equivalent.

THE best conductor for the electric current, meaning by "best" that which offers the least resistance to the current, is silver; after silver come in order copper, gold, aluminum, zinc, platinum, iron, nickel, tin.

BOTH Melbourne and Sydney, Australia, have mints. At the former institution the charge for melting, assaying and refining in lots of 1000 ounces gold, or over, is 4½ pence per ounce; in the latter, 3 pence.

IN law, illuminating oil, oil used for lubrication, other lubricants, gasoline used for fuel in a mining plant, can not be considered as enhancing the value or becoming part of the machinery, and, hence, is not lienable.

THIS PAPER constantly proffers the use of its pages in the exchange of practical ideas and experiences, of methods of doing work and of effecting improvements and economies which sometimes escape the notice of the less observing.

UNDER the statutes of the State of Idaho, a location notice of a mining claim which fails to give the direction of the initial point or permanent monument to which it is attempted to tie the location, from the point of discovery, is void.

THE noise and odor of gas and oil engines may be considerably suppressed by placing inside of or on the top of the cast iron chamber in which the products of the explosion are generally received, a few scrubber rings, such as are used in gas works.

COURTS have decided that the words "trustee" or "agent," following a name on the face of a certificate of stock, practically mean nothing, being merely "words of description," and that the stock belongs to the person whose name is on the stock.

IN assaying copper bullion when there is more gold than silver in the sample, it takes considerably more lead to scorify or cupel away the copper than when there is an excess of silver over gold, the latter being more tenacious of copper than silver is.

A BARREL of California petroleum of average quality will furnish 10 gallons kerosene worth 15 cents per gallon, 5 gallons benzine worth 16 cents per gallon, 5 gallons gasoline worth 17 cents per gallon, 10 gallons lubricating oil worth 16 cents per gallon and 50 cents worth as-

phaltum—a total of \$5.25 from a barrel of crude oil worth for fuel purposes much less. In the separation and refining of these products lies much of the value and profit of the oil industry.

A STEAM ENGINE that develops 55 H. P. with 37.5 pounds mean effective pressure per square inch when running at 184 revolutions per minute, would develop 82.315 H. P. when running at 246 revolutions per minute with a mean effective pressure of 42 pounds.

THE standard horse power rating for boilers, as adopted by the American Society of Mechanical Engineers, is an evaporation of thirty pounds of water from a feed water temperature of 100° F. into steam at seventy pounds gauge pressure as the equivalent of 1 H. P.

DRY STEAM contains no moisture and may be either superheated or saturated. In the latter case it is usually called dry-saturated steam. Wet steam has the same temperature as dry-saturated steam at the same pressure, and contains moisture, usually as mist or spray.

WHERE two veins, having apexes in different claims, unite in their dip within the perpendicular extension of the side lines of another claim, the owners of the last claim can not control as to the rights in the vein beyond the point of union, since they have no interest in either vein.

GALENA carrying thirty ounces silver per ton, 10% lead and 12% sulphur admits of slag roasting without material loss; where the lead percentage is over 10%, but not over 20%, smelters say such ore should not be more than sintered; when over 20% the charge should be only plain roasted.

THE proper amount of heating surface per horse power for boilers in stationary plants is: For horizontal tubular boilers 12 square feet, and for water tube boilers 10 square feet, the boilers being in each case capable of being forced economically to between 50% and 60% above the rated capacity.

AFTER a commutator becomes slightly worn, a copper brush will give better results while waiting for a chance to turn the commutator down, than a carbon brush; but the carbon brush will wear more evenly, so that, starting with a new machine in first-class order, carbon brushes are the best.

ALL unoccupied lands of the United States containing salt springs or deposits of salt in any form, and chiefly valuable therefore, are subject to location and purchase under the provisions of the law relating to placer mining claims. The same person cannot locate or enter more than one such claim.

TO PREVENT spontaneous combustion of coal on sea voyages the coal should not be loaded earlier than one month after it is mined, should be stored only on iron floors and should be covered. The height of the heap should not exceed 7½ feet and steam pipes and flues should be at least 20 feet away.

IN the decomposition of iron pyrites the sulphide becomes a sulphate, which, when further oxidized in the presence of water, is resolved into sulphuric acid, and hydrated oxide of iron. The gold intimately mixed with the pyrites, mayhap originally deposited therewith, remains, being insoluble in the waters which dissolved the iron.

THERE is abundance of antimony deposits in California, but few are worked, chiefly because of the cost of smelting, where the ore is treated for the antimony alone. The ore may run 40% antimony and \$50 gold per ton, but the gold does not count in ordinary smelting, as it would ordinarily cost more to separate it from the antimony than it is worth.

A ¾-INCH NOZZLE, under 100 pounds pressure will, theoretically, discharge 1170 gallons per minute. The theoretical discharge of water from a nozzle may be found by multiplying the area of the orifice expressed in square feet by the velocity of the water in feet per second. The product will be the theoretical discharge in cubic feet per second, which multiplied by 7.5 will give the number of gallons.

IN a gas engine in which a piston igniter is used there is required a projection upon the piston, and in such a position that it is far removed from the water jacket, so that it may become heated to a degree which causes it to operate in the same manner as a hot tube, for the compression of the charge produces a rise of temperature which causes the mixture to ignite more readily than when it is at the ordinary temperature of the atmosphere.

A TON OF COAL carbonized in gas works yields generally 10,000 to 11,000 cubic feet of gas, which hold in diffusion twenty to twenty-four pounds of hydro-carbon vapors, including sixteen to eighteen pounds of benzol, about 120 pounds of liquid tar, of which twenty-five to thirty pounds are carbon held in suspension, two or three pounds are hydro-carbons similar to the vapors above mentioned, and twelve to fourteen pounds are naphthalene.

LIME MORTAR should never be mixed with concreting. Concrete should consist of one part Portland cement, two parts clean sharp sand, two parts clean gravel, thoroughly mixed with sufficient water to form a hard, solid mass when well beaten down into a bed, which should be from 2½ to 3 inches thick. If the concrete bed can be made over 3 inches in thickness, the concrete can then be made of one part natural cement, one part clean sharp sand, one part clean gravel, thoroughly

mixed with sufficient water as above directed. For floors the surface of the concrete must be level and finished to within 1 inch of the finished floor line, when tile ¾ inch thick is used, which will leave a space of ¼ inch for cement mortar, composed of equal parts of the very best quality Portland cement and clean, sharp sand.

COBALT is used extensively in the arts and in the manufacture of dyes, producing a bright purple coloring matter, its use being confined almost exclusively to Europe. In this country there is but one manufacturing plant using oxide of cobalt—the American Nickel Works, Camden, N. J. This company gets its cobalt from Canada in the shape of nickel matte, and uses it only in connection with the manufacture of nickel.

DISTILLATE is freely and frequently used in gas engines, it having a gravity of from 35° to 56°. The lower grades are sometimes dirty and have a tendency to foul the engine; but, if before the engine is shut down the distillate is turned off, and gasoline turned on for a few minutes, the engine is cleaned and that trouble obviated. It is cheaper than gasoline, goes further but necessitates that the engine be run with very hot air; and, rightly used, is generally satisfactory.

THE newspaper report of a railroad collision is away behind the times where it says that when the engineer saw the danger "he whistled 'down brakes,' reversed the lever, and jumped off." No one on a modern railway freight or passenger train knows or hears anything of "down brakes." The locomotive engineer who sees impending collision shuts off steam, applies the air brake, opens the sand valve, and then (if he has time) jumps. Doing all but the last takes about five seconds. A railway engineer wouldn't reverse the engine after the air brakes had been applied, as such reversal would reduce their resisting power.

ONE may generally count upon a practical working efficiency of 80% in a hydraulic motor, i. e., the power communicated to the pump is 80% of the water power expended. This is only true when the head is measured close to the wheel. When, as is sometimes the case, the head appertinent to the water power represents the descent from the pond or canal to smooth water below the wheel, not more than 75% can be practically assumed. A loss of as much as 12% may be expected in pumping, and ordinarily as much as 5% in transmission through the pipes. An efficiency of 80% may be assumed in the motors through which the water acts to drive machines. Thus, the percentage of gross power which can be imparted to machinery at a distance of a mile or more from the source is not more than  $0.75 \times 0.88 \times 0.95 \times 0.80 = 0.50$ .

THE wear on a narrow mortar is rapid when hard ore is crushed, and it is always preferable to introduce steel liners. Wear is especially great just back of the middle stamp. In case of a hole in the back a quick repair may be made by using the principle employed in closing a hand-hole in a boiler. Have the blacksmith set a bolt ¾ inch by 6 inches in a plate of steel of suitable size, the bolt having a long thread on the end opposite the plate. Put washers or gaskets of belting or gasket rubber of a size and shape to roughly conform to the worn place in the mortar on the bolt and next to the plate. From the inside of the mortar push the bolt end through the hole, the plates and gaskets, of course, remaining outside. Then, from the outside, add another gasket or two and a large cast iron washer, upon which set a nut, and complete with a jam-nut. This is a "blacksmith's" job, but it is effective and renewable, and can be made to wear out the rest of the mortar, meantime saving a shutdown and attendant loss.

THE most important product of petroleum is that portion which passes over at temperatures above 183° C., and which constitutes what is usually known as kerosene—various other trade names being applied to it in different degrees of purity, and by different manufacturers. In the manufacture of these burning oils care must be taken that the more volatile compounds are separated, and that the temperature be not pushed too high; in the latter case the oil is cracked, i. e., the denser oils remaining in the still are dissociated, forming highly volatile compounds, which mix with the product. In either case the kerosene is liable to give rise to accidents, either by igniting, in case the lamp is broken or overturned, and, in very bad oil, by forming with air a mixture which may explode the lamp. In order to guard against such accidents, laws have gradually been framed in various States and countries, regulating the manufacture, transportation, sale and storage of these oils. The tests to which they are subjected relate to the temperature at which they give off inflammable vapors and at which they ignite. The tests are applied by gradually warming the oil and noting the temperature indicated by plunging a thermometer in it, at a time when a lighted match carried over the surface produces a flash, and the temperature when the oil itself ignites; the former is known as the "flashing point," the latter as the "burning point;" the former is about 5° to 8° C., or 10° to 15° F., below the latter. It was formerly supposed that an oil flashing at 43° C. or 110° F. was safe; but subsequent experience has shown that kerosene gives off explosive vapors at a temperature 5° to 8° C., or 10° to 15° F., below the flashing point, and 14° to 17° C., or 25° to 30° F., below its burning point, and serious accidents have resulted from the use of oils of 110° flash. A kerosene is now required, therefore, to have a flash point of 60° C., or 140° F., and a burning point of 65.5° C., or 150° F.; an oil of lower test is unsafe.

## Oil Engines in Mining and Milling.

Written for the MINING AND SCIENTIFIC PRESS by A. W. WARWICK.

In mining and milling in the arid zone or above timber line, water and fuel economy is highly important. In the initial stages of the work, in such localities, animal power is greatly used. When, however, animal power becomes too expensive or slow, and mechanical power is required, we need a motor (1) that requires little or no water; (2) that utilizes to the utmost limit the potential energy of the fuel; (3) that is safe. These conditions are more or less fulfilled by the gasoline, distillate, oil or petroleum engines, as they are variously called. In southern California and Arizona practically all such motors use a petroleum product of greater density than gasoline; it is, therefore, a misnomer to refer to such engines as gasoline engines. Year by year heavier petroleum products are being used, and hence the best mechanical writers use the term petroleum engines, in preference to the other terms, as it includes the whole. The application of such engines to mining work has greatly extended during the last few years, for hoisting, pumping, air compressing and mill and electric light work around mines.

It would be useless to deny that a great prejudice exists against such engines; so many failures and accidents have been recorded during the last few years that this prejudice is very excusable. Still, we know that steam plants are not free, by any means, from accidents. On an average nearly two boiler explosions occur daily throughout the United States, and the casualties amount to hundreds annually. It may be remembered that during 1898 many failures of petroleum engines occurred. As the writer was about to purchase such an engine at that time, investigation was made into the causes of the accidents and failures. In almost every case there was either gross carelessness or ignorance. Overloading, overheating of cylinders and tampering with the ignition point while running were the chief causes of failure. In the majority of the cases the "accidents" should never have occurred.

While speaking of accidents, a reference may be made to some statements of petroleum engine manufacturers. They say, for example, that any unskilled man can run such engine, because it is so easy to start and stop. This is correct when the engine is in good shape; but how is it when anything gets out of order? Surely an unskilled man would be helpless. The manufacturers, by sending out their engines to be handled by roustabouts, are very largely responsible for the prejudice existing against their machines. The absolute facts are these: Any man with good intelligence can run the machine, i. e., start, stop and oil it, but at least one man should be around who can see that the engine is kept in shape and who can make the necessary adjustments with accuracy. The engine works perfectly automatically when in good order; it therefore requires but little attendance under such conditions; if, however, the engine "bucks," a good man being at hand will prevent many a vexatious delay.

The petroleum engine only differs from the gas engine in a few details. They nearly all work on the same principle, viz., the four cycle or Otto principle. The cycle is as follows: (1) The piston on its outward stroke draws in air and oil spray; (2) on its return the mixture of air and oil vapor is compressed; (3) nearly at the end of this compression stroke the explosive mixture is ignited, and the force of the heated air and products of combustion force the piston outwards; (4) on the next return stroke of the piston the burnt gases are expelled and the engine is ready to perform the same functions again. This cycle was first enunciated by Beau de Rochas and first applied by Otto in his gas engines, and to it is due the great efficiency of these motors.

In carrying out its work economically this engine requires careful attention to the following points, (1) cooling of cylinder, (2) correct point of ignition of explosive mixture, (3) close governing, (4) absolute action of petroleum pump, (5) thorough lubrication, (6) selection of the most suitable petroleum product.

**COOLING OF CYLINDER.**—It is generally accepted that to get the best work out of the petroleum engine that the temperature of the cylinder should not rise above 150° or 160° Fahr. In order to do this the engine will require just about five gallons of water per horse-power hour to circulate through the water jacket: the water to have an initial temperature of 60° Fahr. A test was made on a 34 B. H. P. Fairbanks-Morse engine using "Puenete" distillate, developing at the time of test 30.5 B. H. P.; 2½ gallons water per minute were passing through the water jacket. The temperature before passing through the water jacket was 65° Fahr., after leaving the water jacket 172° Fahr.; the thermal units contained in this water is found by multiplying the weight by the rise in temperature, or  $22.92 \times 107 = 2452\frac{1}{2}$  B. T. U. per minute passing away in the cooling water. If the cooling water is to be used over and over again, this heat must be dissipated by radiation from the sides of the water tanks. The usual rule for calculating the heat radiated by iron tanks containing hot

water is, that 100 square feet of radiating surface gives off two heat units per minute for every degree of difference between the temperature of the tank and the temperature of the atmosphere. Then at a tank temperature of 172° Fahr. and an atmosphere of 60° Fahr., 100 square feet would give off 224 heat units: therefore to dissipate 2452 heat units will require 1100 square feet of surface. The writer has rarely seen this tank surface and where tanks are used and the engine doing steady work the engine has almost invariably too hot a water jacket. In the desert zone, where the temperature is for weeks at a time 115° to 120° in the shade, cooling tanks are of no use. There is too little radiation. In this case a portion of the water supply of the mill is run through the engine tank. (This water may be used afterwards in the battery as it does not come in contact with oil.) About 1000 gallons per shift was found to be about sufficient for an engine developing 30 H. P. It pays to keep the cylinder fairly cool as it affects an economy of fuel. When the cylinder is too hot the engine "kicks" or gives a disagreeable vibration before the compression stroke is completed.

**IGNITION POINT OF EXPLOSIVE CHARGE.**—To obtain the greatest commercial effect from the oil used the ignition point is set to occur just before the crank reaches the dead center at the compression stroke. It takes time for the petroleum gas to burn and in order to get the greatest explosive effect the gas should burn in a highly compressed air charge. The gas, commencing to burn before the piston has reached the dead center, develops its greatest power almost immediately after the piston commences its outward stroke and the gas is more completely burnt: effecting, as above pointed out, a great economy of oil. The ignition of the charge is effected by a Leclanche battery or small dynamo. The latter is by far the cheapest in running and gives a stronger spark than a battery. The hot tube is not often used, although most engines have one attached as a precaution. The dynamo should have a small battery auxiliary to use when starting up. The dynamo should give about five volts and six amperes.

**GOVERNING.**—In the petroleum engines used on the Pacific slope the governor is almost universally of the "hit and miss" class. That is, when the engine runs above speed the governor throws out the oil feed and the engine misses an explosion. When the engine has heavy flywheels the speed can be governed within 5% of the regular speed or even closer. Another form of governor sometimes seen is of the throttling order. This, however, while giving a very close regulation of speed, is not as economical as the hit and miss governor. For very close governing, as in electric light work, the throttling governor is to be preferred. For mine and mill work, where even a dynamo is driven, the hit and miss is preferable on account of its economy.

**OIL PUMP.**—Many failures are to be attributed to the oil pump: the pump requires careful attention. The valves and seats should be cleaned from time to time and the stuffing box through which the piston works should be well packed and the cup gland filled with oil. The suction pipe should be soldered together, placing no dependence upon the screwed couplings owing to the oil searching out the least defect. The end of the suction in the oil tank must be covered with fine wire gauze to prevent the least dirt passing through and checking the valves.

**LUBRICATION.**—It is stated from time to time that the petroleum engine requires little cylinder lubrication. This is not the case. For engines of equal power the petroleum engine uses three times the oil fed to the cylinder of the steam engine. Nothing but the special cylinder oil made for these engines should be used, if possible, in the cylinder. For the bearings, crosshead, etc., use a somewhat heavier oil than the cylinder oil, and feed plenty of it. The mere non-heating of the bearings is no criterion of the right oil feed. By using a liberal supply of oil the co-efficient of friction can be greatly reduced. The engine should be provided with oil guards, or casing, of sheet iron. To economize on lubricating oil do not stint the feed, but obtain an oil filter, of which there are numerous inexpensive kinds on the market.

**FUEL.**—Most of the petroleum engines in the Southwest use a product known as distillate in preference to gasoline, the former being not only cheaper but contains many more heat units than gasoline. It may be taken that 2 gallons Puente distillate (45°) is equal to 3 gallons ordinary stove gasoline. The distillate is not as volatile as gasoline and evaporation loss is not as great. Distillate is colorless, inodorous and has a specific gravity varying from 0.798 to 0.801. The consumption of fuel may be taken as  $\frac{1}{10}$  to  $\frac{1}{15}$  gallon distillate and  $\frac{1}{10}$  to  $\frac{1}{15}$  gallon gasoline per actual horse power hour. The thermal value of Puente distillate (45°) may be taken as 18,500 B. T. U. In comparing the fuel values of distillate and ordinary Western coal, the former being used in a petroleum engine and the latter in making steam for an ordinary small steam engine, using 6 pounds coal per horse power hour, we find that  $\frac{1}{10}$  gallon (0.55 pound) distillate will do the work of 6 pounds coal; therefore 1 pound distillate is equal to 10.9 pounds coal, or 1 gallon distillate is equal to 72 pounds good Western coal. Distillate costing 16 cents per gallon is equivalent,

therefore, to coal at \$4.45 per ton, both delivered. Should distillate cost 20 cents per gallon, it would be equivalent to coal at \$5.50 per ton or wood at \$3.75 per cord, all delivered. The petroleum engine is, therefore, an inexpensive machine to operate.

**EFFICIENCIES.**—The working efficiency of the various American petroleum engines is very difficult to obtain. Our European friends seem to devote more attention to this very important subject. This is somewhat surprising in face of the fact that American manufacturers are far more liberal, as a rule, in giving information to the public than their foreign competitors. So far as the writer has been able to learn, the best reported test of a European petroleum engine gave an efficiency of 21%\* of the total power contained in the fuel. The average engine gave about 16%. The writer made a test lasting for two months on a 34 H. P. engine made by Messrs. Fairbanks & Morse and operating a 10-stamp mill. The test was conducted in the following manner: (1) A series of tests were made to determine the actual power required by each portion of the mill; (2) a log was kept, giving the exact time each portion of the mill was in operation; (3) careful track was kept of the distillate used; (4) the temperature of the cooling water was noted at intervals. From this data the efficiency of the engine was determined. It is not claimed for these tests that the scrupulous care was observed such as is the case at exposition trials, but they will give the commercial result from which any accidental errors are reasonably eliminated. The following gives one day's results:

|                                            |                           |
|--------------------------------------------|---------------------------|
| Water in cooling tank.....                 | 1,800 gals. (15,000 lbs.) |
| Temperature at 7 A. M.....                 | 73° F.                    |
| Temperature at 6 P. M.....                 | 167° F.                   |
| Thermal units in water + 10% for loss..... | 1,551,000 B. T. U.        |
| Average power developed.....               | 29.6 B. H. P.             |
| Distillate used (6.6 lbs. per gal.)..      | 27½ gals. (183.1 lbs.)    |
| Thermal value of distillate.....           | 18,500 B. T. U.           |
| Total heat used up.....                    | 3,387,350 B. T. U.        |

Knowing that 1 H. P. should be developed (if there is no loss) by 2545 B. T. U. per hour, we can readily calculate the efficiency of the engine. Thus:

|                                                                 |                             |
|-----------------------------------------------------------------|-----------------------------|
| Heat lost in water cooling, per hour $\frac{1551000}{24}$ ..... | = 141,000 B. T. U. = 45.78% |
| Heat used up in producing power, $29.6 \times 2545$ .....       | = 75,332 B. T. U. = 24.47%  |
| Heat lost in exhaust gases and friction.....                    | = 91,609 B. T. U. = 29.75%  |

Total heat produced by combustion per hour.. 307,941 B. T. U. 100.00%

In this particular test we see that the efficiency of the petroleum engine in question was 24.47%. In the whole series of tests the lowest result was 22.6% and the highest 28.2%. The mean of the whole was 26.2%. This is a remarkable showing for this engine, and it would be interesting to have the efficiencies of other petroleum motors. A test on a small Foss engine of about 1894 make, and not in very good condition, gave to the writer an efficiency of 20.75%. It is not fair to compare these efficiencies on account of the disparity in size and condition.

**WORKING CHARGES IN MILL.**—By use of this motor in desert countries the working charges may be greatly reduced. It is conceivable that the charges may be brought nearly to a parity with more favored districts. The man in charge of the engine, having no boiler to fire and attend to, and having only to give a glance at the engine once in a while, is able to attend to the battery without neglecting either battery or engine. A man able to take care of an engine and the amalgamation, etc., in a battery is somewhat rare. In this case one of Mr. Harmon's dicta† is quite applicable—the mill superintendent should be able to make a "millman" out of raw material. Any number of good, smart engineers can be found who would be willing to learn how to run a stamp battery. A little extra pay is quite an inducement. Under these circumstances two men per shift can take care of a 10-stamp mill and not be too hard worked. A 10-stamp mill will require about fifty-five gallons distillate per twenty-four hours, which at 16 cents per gallon amounts to \$8.80. This is by no means an exorbitant price to pay for power. Taking all expenses into consideration, there is no reason why the total milling costs should exceed 85 cents per ton even in a desert mill of ten heads.

**PRACTICAL CONSIDERATIONS.**—No mill engine of the petroleum type should be run continuously to its full rated capacity. It is not a safe motor under such conditions. The engines are guaranteed by the makers to have developed the power at which they are rated. To develop this power, however, the engine must make twelve explosions to twenty-four revolutions of the crank shaft. The engine can not work above this capacity, and, if a load is accidentally thrown on above it, it will simply stop. In this case the strains will be enormous and an accident is likely to occur.

Among men of long experience with petroleum engines it is generally believed that such engines should not be run continuously above five-sixths its rated power—say 25 H. P. on a 30 rated H. P. engine. When there is any doubt as to the load to be pulled

\*The Diesel motor has given 35% efficiency and over.

†See article "Stamp Mill Practice," issue of Dec. 1, 1900.

by the engine, err on the side of safety. This engine is not like the steam engine; the only loss in under-loading is the engine friction, and the fuel economy is not much less. Have a man around who knows something of these engines and don't give the engine absolutely into the charge of a roustabout. In selecting an engine, look to the simplicity of the design and to the quality of material and workmanship put into it rather than to the price. A cheap engine can be made by inferior material and workmanship being put into the machine. It may be the costliest in the end. Unless the purchaser is an expert in machinery and is able to judge of the merits of a new type of engine, he would do well to make his selection from one or other of the half dozen good standard makes, especially if he is not spending his own personal money. Insist on the man in charge of the engine keeping it clean and neat. If properly designed, altitude has but little effect upon the efficiency.

It should be remembered that an oil engine designed to develop a given power at sea level can not develop that same power at a higher altitude, nor in such a case can the same fuel efficiency be obtained. It is highly important in ordering an engine to specify the altitude at which the engine is to work, so that the manufacturers may be able to make the necessary adjustments called for by the altitude. Where an aneroid barometer is not available, the altitude can be determined by the boiling point of water thus: (1) When the boiling point is below 200° F., subtract the boiling point from 212 and multiply the remainder by 525. (2) When the boiling point is higher than 200° F., multiply the remainder by 500. This will give the altitude close enough for the engine makers. At 6000 feet elevation an oil engine of given size will develop only 90% and at 10,000 feet about 80% of the power it would develop at sea level. It will also consume from 10% to 20% more fuel per horse power hour. By speeding up the engine and cutting down the oil feed to suit each case, better results than these can be obtained. It is somewhat surprising that engine makers have not paid more attention to the design of high altitude engines.

**PETROLEUM ENGINES IN MINING.**—These engines are coming largely into use for hoisting and pumping. For prospecting work the hoist operated by these motors is of the greatest economy. Under such circumstances the work to be done is very intermittent; and when no work is to be done, the petroleum engine can be shut down, but is ready for work at a moment's notice again. A steam engine requires the fire to be banked, and, if a sudden call is made upon it, it can not respond till steam is raised. The economy of the petroleum hoist is very great. Where the work is of the usual prospecting kind, the hoist will not require more than three or four gallons distillate per shift, say 85 cents to \$1 fuel and lubricant charges. It would be a wonderful steam hoist that could equal this. This hoist readily adapts itself to being operated from the collar of the shaft by rods leading back to the friction and brake gear. This is a great convenience when there is only one man on top, as he can quickly and readily attend to the dumping of the bucket.

There are two types of such hoists made—(1) the engine and drum are on the same bed plate; (2) the engine and hoist are separate and distinct. The writer prefers the latter type for two reasons: 1. The engine is more adaptable for other work, such as driving a fan, circular saw or pump. 2. The exigencies of the design in the first type of hoists call for a drum of small size. The advantages of an engine which is able to do such work as driving a fan, especially in a hot climate, for ventilation underground, is too obvious to require dilating upon. The second point, as to the size of the drum, is another matter. It is well known, of course, that a rope should not be passed over too small a drum or sheave wheel. On the combined hoist and engine the drum is rarely more than 24 inches diameter, using a  $\frac{3}{8}$ -inch steel rope. According to the accepted formula, the strain due to bending caused in this case would be about 6800 pounds. The allowable strain in such a rope is 7800 pounds; it is obvious, therefore, that the allowable total load hoisted should not exceed 1000 pounds. The writer has used a hoist, where these conditions existed, where the load was frequently 1500 pounds, and after eighteen months the rope was apparently as good as new. One can frequently see in Arizona, and elsewhere, hoists working in this way. This naturally suggests the ideas: (1) Either the strains due to bending are exaggerated, or, (2) the rope is working under a dangerous strain. In regard to the latter idea, the writer has never heard of a rope breaking on these hoists, although such undoubtedly has occurred. In Arizona, where large numbers are used, one would expect to hear of such failures frequently, if the rope were under a dangerous strain; yet such is not the case. Still, it is disquieting to have a feeling of unsafety about a hoisting rope, and it is well to err always on the side of safety. It may be well, therefore, if the makers of such hoists would enlarge the size of the drum. This can be readily done when the engine and hoist are on separate bed plates, and for this reason the writer prefers them. Having had no experience with petroleum engines when operating air compressors, this use will not be considered.

A serious disadvantage of the oil engine is that it

will not start under a load. By having the engine drive onto a friction-clutch pulley, this disadvantage can be obviated to a certain extent, for then the load can be thrown on after the engine has attained speed, doing this slowly, of course. By vigorous work, using the starting pump to its utmost, these engines will just start a 10-stamp mill if the stamps are hung up.

A useful little device may be described, which is of great help in starting a large oil engine, without men holding back the flywheel. A pair of angle brackets (A) of small size are secured to the floor, about 8 inches from the engine frame and about 2 feet from the cylinder end, according to size of engine. A lever of wood (B) about  $1\frac{1}{2} \times 2\frac{3}{4}$ , is held between these brackets by a pin passing through. The lever can work freely in a direction at right angles to the engine. Near the top of the lever is an arm (C), about 10 inches long, held by a pin, so as to allow the arm to move vertically. The flywheel is moved over until

the crank is in position, ready to fire the starting charge. The arm of the lever is thrown over a spoke of the flywheel, so that the latter cannot move forward. Opposite the end of the arm is fitted a catch (D) to the engine frame by means of set screws; when the whole rig is in place the flywheel cannot move over. The starting charge is pumped into the cylinder; the lever is jerked out and the charge ignited simultaneously. The engine can thus be started by one man only. Of course, this device cannot well be used when the compression is obtained at starting by revolving the flywheel. It should have been noted that when distillate is used the engine must be started with gasoline, of which about one-half pint is required to start a 30 H. P. engine.

There is a great future for the petroleum engine, especially if means are successfully introduced to allow the use of heavier petroleum products than gasoline or distillate.

After 140 years of experimenting, the best steam engine can only give back 16% of the power locked up in the fuel. It is less than fifteen years since the petroleum engine has been in commercial use. The best modern engines of this type give over 25% efficiency. It has been stated that the Diesel motor has given an efficiency of over 35%. We may expect this type of engine to play an important part in the development of the arid zone, or wherever water and fuel are scarce. In Arizona and southern California these engines have already been of inestimable service.

#### Braun's Coronet Rolls.

Herewith is illustrated a new machine with novel features, especially designed for the use of assayers. A feed plate that is tangent to the contact point of both rolls is designed to obviate the difficulty of in-

serting a small bullion button between the rolls. This plate leads to the opening between the rolls; the button to be rolled is placed on the feed plate, and may then be easily pushed between the rolls with a pair of pincers. Opposite the feed plate, where the foil or coronet emerges, there is another plate that

closely wipes the bottom roll and conducts the foil away from the rolls, preventing the coronet from dropping to the floor or becoming lost. The upper roll has a shallow groove cut longitudinally across its face, which, when brought to the point where it is contiguous to its fellow roll, insures positive feed of any bullion button inserted. Further information will be gladly accorded by the makers, F. W. Braun & Co., Los Angeles, Cal.

#### To Prevent Accidents.

In Leadville, Colo., is a new device at the Penrose shaft-house designed to prevent an accident common about mines, namely, the running of a cage or bucket through the sheave wheel, known as a safety detaching hook. The cable passes through an iron plate below the sheave wheel, and, if the cage ascends to this point, the upper clevis is detached by the severance of a copper rivet, iron flanges are released and hold the cage beneath the iron plate, while the upper clevis attached to the cable swings clear. Recently a practical test was given; the cage was sent up toward the roof of the shaft-house, with the possibility of an accident if the new apparatus did not work. The mechanism performed its work, the copper rivet was cut in two, releasing the cable and allowing the cage to hang suspended. A new rivet can be inserted and operations resumed in ten minutes after the cage is caught. There are about fifty of those safety hooks in successful operation throughout the State of Colorado.

#### Thirty Years Ago and Now.

A comparison has been made between the cost of mining in Georgetown, Colo., in 1870 and 1901 by the Courier. The figures are:

|                              | 1870. | 1901. |
|------------------------------|-------|-------|
| Steel, per pound.....        | \$ 40 | \$ 10 |
| Iron, per pound.....         | 25    | 05    |
| Rope, per pound.....         | 60    | 12    |
| Giant powder, per pound..... | 1 00  | 15    |
| Caps, per 100.....           | 3 00  | 60    |
| Fuse, per 100 feet.....      | 3 00  | 50    |
| Lumber, per M feet.....      | 60 00 | 20 00 |
| Candles, per box.....        | 20 00 | 5 00  |
| Nails, per keg.....          | 20 00 | 4 00  |
| Coal oil, per gallon.....    | 3 00  | 25    |
| Miners, per day.....         | 4 00  | 3 00  |
| Freight rates.....           | 20 00 | 6 00  |

#### An Official Statement.

Relative to the legality of eight persons giving power of attorney to locate placer claims without number, thereby enabling a few persons to hold large areas of the public domain, it is well recognized that under existing mining laws claims may be located by agent; that one person may locate a claim not exceeding twenty acres, or eight persons may associate themselves in the location of one claim not to exceed 160 acres. There is no limit to the number of claims that any person or association of persons may locate.

BINGER HERMANN,

Commissioner General Land Office.

Washington, D. C., March 16, 1901.

GEO. W. SPOULE, Clerk of the U. S. Court in Montana, has his own opinions as to what are legal costs. In the case of the Colusa-Parrot Mining & Smelting Co. against the Anaconda Copper Mining Co., which was decided in favor of the latter, the original cost bill was for \$275,749.73, but Mr. Sproule recommends that it be cut down to \$317.70. He thinks the charges for expert testimony are excessive, and offers to pay R. W. Raymond, Clarence King, N. S. Shaler, and others, \$1.50 per day, but no traveling expenses. He says: "There being no express provision of law, nor any course or practice of this court with reference to the following items contained in said cost bill, I will disallow the same, as follows: Assaying account, \$4,789.50; services of experts in preparing for trial, \$25,450; laboratory expenses, \$1,583.58;

expense in preparing photographs of mine workings, \$72.25; expense of development work, \$189,020; expenses incurred in the preparation of maps and models, \$35,324.25; expenses incurred in securing reports of testimony, \$3,156.02."

STEAM-DRIVEN factories cannot thrive in localities where fuel is dear. It does not seem as though the four or five million gallons of oil that California is annually producing will alter the situation materially, for, according to present indications, it is idle to believe that the price of oil to the consumer will be permitted to drop a single shade below that necessary to underbid the coal dealer. If it does fall to such a price as will enable California manufacturing industries to compete in the markets of the world, it will be because the oil magnates have been brought to realize the fact that their competitor in California is not high-priced coal, but electrically transmitted power. This is one service which a plentiful supply of energy from the mountain streams will, in all probability, render toward developing manufacturing in California.—The Journal of Electricity, Power and Gas.

## Spitzkasten--Hydraulic Classifiers--Concentrators.

Recent mention of the German gold-milling system has elicited comment and inquiry concerning the details of the methods referred to, which, for purposes of individual comparison, are outlined herewith:

By reference to Fig. 1 it will be noticed that the apparatus consists of two sheet-iron prisms sitting one in another; the inner one can be moved by a hand screw as far apart from the outer one as desirable. Overhead runs a water pipe, from which connections are made to the bottom of the outer prism, pressing a stream of clean water upwards, designed to hold the floating slime particles in equilibrium, except sands and minerals heavier than the force of that pressure, they falling to the bottom of the spitzkasten and discharged through a spigot bent upwards to nearly the middle of the apparatus. The still suspended slime particles flow on into the second classifier, where the prisms are sitting farther apart, and are designed to lose here the next heaviest grains of ore, the process going on until all the

ter which is used for washing on the vanners exerts one certain pressure; when that force is regulated so that it will act only on the specifically lighter but more voluminous, or more surface-offering gangue grains, cleaner concentrates, and also cleaner tailings result.

The concentrator shown in Fig. 2 is an improvement on the "stein table," and a departure therefrom, designed to separate the gangue from the minerals quickly and cleanly as soon as they are brought on the table, and also separate the freed minerals from each other, as far as their specific gravity will permit. With ideal separation the quartz leaves the table as soon as it is fed from the board on the belt, occupying compartment four of a launder and box in blende, into compartment two; the third, the pyrites, go into compartment three; and the last in order, the galena, apartment four of a launder and box in front of the table. All these products are washed therein by jets of water from a pipe placed diagonally over the belt. This concentrator does not discharge at the ends, but sideways, to which it can be inclined at any desired angle. The classified pulp is fed diagonally upon a rubber belt which travels against the

paratus, as long as they do not form a ready product, even the clean sands from the vanners and buddles being washed through sluices outside of the mill. Only the separated metallic minerals and middlings are hauled and carried on a tramway to the store rooms or the middlings back to the machines. The muddy slimes which really constitute the tailings and come from the spitzkasten represent no larger volume than perhaps a quarter of a pound in a cubic yard of water.

In most cases the gold in the ores is associated—mechanically mixed—with the pyrites, seldom with the galena or blende, but, if so, then usually in juxtaposition with these minerals. For mines far from railroad communication, it is advantageous if they could send their concentrates free of gangue matter and any other volume and weight producing but unprofitable minerals, to the smelting works, or when they do not contain much copper, to the chemical works—a saving of expenses in haulage, in space, in time, fuel, chemicals, etc. It is of importance for mines with poor communication to market, to reduce the bulk of the ore to be shipped, by retaining only that containing the gold.

## The Riecken Process for Treating Telluride and Sulphide Ores.\*

This process is an electro-chemical system for the recovery of the precious metals from ores by a single operation, without resorting to filtration.

The machinery consists of an open iron tank with vertical ends, inclined sides and rounding bottom. The tank is provided with a horizontal shaft passing through stuffing boxes at each end of the tank, proper beaters to agitate the contents of the vat and suitable gear wheels outside the tank for rotation. The bottom and sides of the tank are lined with removable amalgamated copper plates and form the negative pole of the circuit, the positive poles being stationary. By means of a small force pump a stream of mercury is caused to flow continuously over these amalgamated plates, and which, running down to the bottom of the vat, is drawn off through a mercury trap, and again elevated by the pump, thus maintaining a continuous circulation. This keeps the negative plates bright and active, and is the essential condition which effects the precipitation of the gold in such a form that it cannot be scoured off by the attrition of the moving ore. By means of it the gold, whether in coarse particles or fine, is recovered in one operation, no filter presses are required, no precipitation by zinc is necessary, and the bullion commands a high price because of its purity.

The tank is partly filled with salt water, and, after starting the agitators, the ore to be treated is fed in a finely pulverized condition into the water until an easy flowing pulp is produced. From one to two pounds of potassium cyanide per ton of ore to be treated are now added, and a weak current of electricity passed through the tank, with the result that the gold which has been dissolved is deposited on the amalgamated plates as a dense amalgam, so hard as to quite resist the attrition of the coarser particles of ore. Any coarse gold under the brightening action of the current and of the cyanide will be mechanically amalgamated.

When the operation is finished the contents of the tank are allowed to flow to waste, or, if water is scarce, to settling tanks, when, after settling, the clear water may be pumped back into the apparatus for further use and the cycle repeated.

The apparatus now in successful operation at the South Kalgurli mine consists of two specially constructed vats of iron, lined with removable copper sheets, which render them rigid, riveted to  $\frac{1}{4}$  inch plates. These two tanks are 12x8 feet wide at the top and 11 feet deep, capable of treating jointly sixty tons per day. Not over 3 H. P. will be required to agitate the ore and produce the current for each 15-ton vat.

The operation of the plant being conducted automatically, less labor will be required than is necessary in the ordinary cyanide process, and the ore being handled as a sludge, there is no hand labor in filling and discharging vats; a solution containing .05% of cyanide is sufficient with most ores to run the tailings down to below 1 dw.

The loss of floured mercury will not exceed two ounces per ton of ore treated.

### ESTIMATE OF COST.

|                                                     |       |
|-----------------------------------------------------|-------|
| Cyanide, 2 lbs, at 1s 2d per lb.....                | 2s 4d |
| Mercury.....                                        | 0s 3d |
| Power, $\frac{1}{2}$ H. P., coal at £2 per ton..... | 0s 6d |
| Labor.....                                          | 2s 0d |
| Water, 200 gallons (recoverable).....               | 1s 0d |
| Labor and stores for engine and dynamo.....         | 0s 6d |

Cost per ton treated.....6s 7d

To this must be added the cost of the necessary mechanical preparation of the ore, viz., crushing, and, when treating tellurides and sulphides, the cost of roasting. Both operations, if properly conducted, ought not to exceed 7s 6d per ton. To this add 1s for repairs, etc., and the total per ton treated amounts to from 14s to 16s.

The Riecken process consists merely in agitating

\*Condensed from article by H. R. Cassel, in London Mining Journal.

FIG. 1.

FIG. 2.

coarser grains of the sands and heavier mineral particles are separated from the finer slimes. By the inner prism the operator is enabled to regulate the weight of the water column standing above the water pressure from below, in the effort to grade the different ore particles into their exact weight and size as they exist in the traveling ore pulp. The finest slimes flow into a spitzkasten which acts as a settling box, over which a horizontal current of water passes, out of which the suspended ore particles fall into the pointed, funnel-shaped bottom of each compartment, and are discharged through spigots in the same way upon the buddles as the coarser from the spitzkasten on the concentrators. These spitzkasten are of wood and may be given as many compartments as products are desired.

The water with the light, muddy slimes which overflows from the spitzkasten contains usually only such a small amount of the metallic components of the ore that they can be allowed to flow out of the mill, but should there be still an appreciable amount of gold or other valuable minerals suspended in it, then it is directed into settling pits and the settled fine sands and slimes treated on the buddles. With these classifiers are received graded products, i. e., coarser sands besides finer mineral particles whose physical conditions differ greatly, and when brought upon the tables are naturally, not only through their different specific weight, but also through their difference in volume, quickly separated. The stream of clean wa-

ter feed of the ore and moves over two rollers situated on both ends, one of which furnishes the forward movement. This belt rests on a table in which grooves are cut and little streams of water forced through them, forming thereby a cushion which hinders wear and tear. This table rests in a stout iron frame which is suspended on two arms on an iron rod, allowing any desired inclination. It receives about 150 percussions per minute by a cam and spring, situated at the opposite ends of the machine, at the same time the belt travels nearly  $2\frac{1}{4}$  inches per second. By these motions, it is claimed, the table is enabled to separate by specific gravity. The gangue with a certain amount of minerals is discharged on the lower, the mixed and heavier metals with a certain amount of the gangue are carried up to the higher end of the table or belt and there discharged. Should different minerals on the belt of the percussion table touch, or run together somewhat near the lines of their discharge, these are caught and kept for further treatment on the reserve tables. It is built of iron, with a capacity of about eight tons, if the ore is well classified.

The treatment of the fine slimes, so often considered superfluous, is an essential feature in the German system. The buddles shown are said to concentrate very close and tailings show hardly enough minerals to be worth rehandling.

From the time the slimes leave the mortars of the stamps they flow continually from apparatus to ap-

the prepared product in the tanks with dilute cyanide solution, and conducting through the vat a current of electricity, the coarse and fine gold being precipitated as an amalgam which can be retorted into a marketable form with a minimum of expense and loss.

Estimate of cost for labor and fuel, including chemicals, electric current, etc., for treating 100 tons per day in Western Australia, the ore being handled automatically:

|                                                 | Per week. |
|-------------------------------------------------|-----------|
| 3 engineers, 1 each shift, at £4.....           | £12 0s    |
| 3 firemen, 1 each shift, at £3 10s.....         | 10 10s    |
| 3 roaster furnace men, 1 each shift, at £4..... | 12 0s     |
| 1 blacksmith, at £4.....                        | 4 0s      |
| 1 carpenter, at £4.....                         | 4 0s      |
| 36 men, 12 each shift, at £3.....               | 108 0s    |
| 1 mill superintendent, at £5.....               | 5 0s      |
| 1 chemist, at £8.....                           | 8 0s      |
| 1 assistant chemist, at £5.....                 | 5 0s      |
| 1 helper, at £3.....                            | 3 0s      |
| 1 clerk, at £3 10s.....                         | 3 10s     |

Total per week.....£175 10s  
Or per day.....£25 0s

#### FUEL PER DAY.

For roasting and drying 8 tons of coal, at £2 5s.....£18 0s  
130 H. P. 4 tons of coal, at £2 5s.....9 0s

#### CHEMICALS.

200 pounds of cyanide, say.....£15 0s  
100 pounds of mercury, say, lost.....12 0s  
Other chemicals, fluxes, etc.....1 8s

Total.....£80 8s

Add for repairs, incidentals, etc., £2555 per annum, or per day.....7 0s

Total cost for 100 tons per day.....£87 8s

Should oxidized slimes only require treatment by this process, the cost for treating them would amount to about 6s 8d per ton.

#### Parting Assays.

When necessary to determine the amount of gold or silver contained in a given alloy, and the amount of each of these metals present in the same sample, such determination is termed "parting assays." If the quantity of silver in the alloy be more than three times that of gold, the separation may be effected by nitric acid, but the gold will be left in a state of powder. It may, however, be washed, ignited and weighed. Should the amount of silver be small compared with the gold, and the assayer wish to avoid the trouble of inquartation—that is, the adding of the requisite proportion of silver—the alloy may at once be subjected to the action of aqua regia, when the gold will be dissolved, and the silver thrown down as an insoluble chloride. The clear solution containing the gold is then decanted, and when the excess of acid has been expelled by evaporation, the gold can be precipitated by sulphate of iron. The determination of the amount of silver contained in gold by dry assay is a complex operation. One or two gold assays in the ordinary way are made, and at the same time two more assay pieces are passed through the furnace, but without the addition of silver. By this means all the oxidizable metals are in both cases removed, and the difference in weight between one of the cornets resulting from the ordinary assay, and the button of mixed gold and silver as drawn direct from the furnace, must be due to silver originally present in the alloy.

The silver contained in the solution of its nitrate resulting from the common process of parting may readily be recovered by adding an excess of chloride of sodium, which will throw down the whole of the silver as white insoluble chloride. This precipitate, which speedily becomes slate colored on exposure to light, is collected and put into a vessel containing water acidulated with hydrochloric acid, some zinc or iron is introduced, and the silver is rapidly restored to its metallic state, in the form of a dark gray powder. The supernatant liquid having been decanted, this fine metal is washed with dilute hydrochloric or sulphuric acid, in order to remove traces of iron or zinc; but as the removal of the former of these metals may be effected more perfectly, it is used in preference to the latter. After washing and drying, the silver is fused in a crucible with the addition of a little carbonate of soda or niter, and cast into bars.

The alloys of gold and copper are cupelled like the alloys of gold and silver; but as copper has great affinity for gold, it is necessary to use a larger proportion of lead to insure its oxidation when combined with gold than when united with silver, this proportion varying according to the standard and the temperature. For the same standard there must, under similar circumstances, be twice as much lead used in the cupellation of gold as in that of silver. Thus fourteen parts at least ought to be employed in common furnaces for an assay of gold coin which contains 0.100 of copper. There is no inconvenience in employing a little more, as it does not increase the loss of gold. However great the proportion of lead may be that is added to the cupreous gold for the purpose of cupellation, the button always retains a very small quantity of copper, of which a fresh cupellation does not free the gold, and which occasions what is termed the surcharge. This surcharge being very slight, it can be neglected in assays of minerals, but it is

necessary to take notice of it in the assays of alloys. But it is known that the presence of silver much facilitates the separation of copper from gold, and it is rare that an alloy of cupreous gold does not contain a little silver, which must be separated; and when this is not the case a small quantity of that metal can be introduced into the alloy, so as to be in about the proportion of two and one-half parts to one of gold. When an assay is to be of an alloy of gold and copper, a sufficient quantity of silver should be added to fulfil the condition according to the presumed standard, which is approximately determined by a preliminary assay, and then cupelled with lead.

#### PROPORTION OF LEAD TO BE EMPLOYED IN THE CUPELLATION OF GOLD AND COPPER.

| Gold in alloy.        | Lead required. |
|-----------------------|----------------|
| 1000 thousandths..... | 1 part.        |
| 900 ".....            | 10 parts.      |
| 800 ".....            | 16 "           |
| 700 ".....            | 22 "           |
| 600 ".....            | 24 "           |
| 500 ".....            | 26 "           |
| 400 ".....            | 34 "           |
| or less.....          | 34 "           |

#### Mining and Metallurgical Patents.

##### Patents Issued March 19, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR THE PRODUCTION OF VAPOR FROM OILS.—No. 669,987; A. Hays, Salt Lake City, Utah.

Combination with oil chamber having valve-controlled outlet, mixing tube arranged in line with outlet, means for admitting air to interior of mixing tube, outer tube surrounding mixing tube extending above and below ends, downtake passage between two tubes for delivering gas into space below lower end of mixing tube to maintain flame therein; means for causing upward current of air into space below lower end of mixing tube to force flame into mixing tube about outlet, and obstruction to free passage of gas above mixing tube.

HYDRAULIC AIR-COMPRESSING APPARATUS.—No. 669,995; W. J. Linton, Woodstock, Canada.

In hydraulic air compressor combination with stand pipe B and separating chamber C, of separating chamber, a, provided with water conductor pipe b, one or more suitable air outlets; air pipe E, separating chamber a' provided with one or more outlets, c'', openings into which are below lower surface of roof of separating chamber a'.

PROCESS OF TREATING SULPHUROUS ARSENIC ORES.—No. 670,140; E. Petersson, Brussels, Belgium.

Pulverizing ore, in mixing same with carbon likewise pulverized, in heating mixture in retort or muffle to which all inlet of air or other gas is pre-

cluded, in continuing heating until arsenic in mixture has been driven off from ore as sulphide without material reduction and expelled from retort.

CONVEYOR.—No. 670,155; A. D. Jansen, Johannesburg, South African Republic.

Combination with conveyor car, such as H, detachable bucket, such as H', locking device consisting of movable forked bolt, such as K, pivoted to body of car, adapted to receive within its forked end studs h h formed on framework which carries bucket, locking bolt K being retained in position by second locking bolt, such as L, and tension spring L', which prevents forked bolt K dropping by reason of weight of bucket attachment which it continues to bear until second retaining bolt L is knocked out of position by engaging projection or catch L' clamped to main ropeway.

ORE CAR.—No. 670,092; G. E. Woodbury, San Francisco, Cal.

Device for automatically locking and releasing door of tilting ore or coal car from movement of car body on truck, combination of rotatable shaft mounted on car body, locking cam fast on shaft adapted by its rotation to engage and disengage door, rack stationary on truck, gear fast on shaft engaging rack to rotate shaft by rolling contact with rack.

GRINDING MILL.—No. 670,116; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Newton Center, Mass.

Combination with mill casing having feed inlet and discharge opening, of fixed bed stone mounted in casing in vertical position, horizontal shaft, vertically placed runner stone carried by shaft co-operating with bed stone, screen box or casing outside mill casing, chamber of which communicates with chamber of mill casing through discharge opening, screen box having closed upper end, closed upper side against which latter reduced material projected into chamber of screen box by rotating parts of mill is mainly thrown, inclined screen in screen box which finally receives reduced material projected into chamber box, inclined screen located at distance from and thus independent of feed inlet to mill casing so that it is not subjected to wear by incoming coarse or unreduced material.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ARIZONA.

#### COCHISE COUNTY.

Near Fairbanks the Arizona Concentrating Co. of Phoenix is operating on the tailing dump at the old Grand Central mill, which ran ten years ago on Tombstone ores. Their method is to sluice the material down into a clarifier, then pass it over canvas tables having numerous small nails, which act as riffles. They run about fifty tons per day, the saving being in silver and lead.

Fairbanks, March 18.

The Calumet & Arizona M. Co., made up of Calumet & Hecla and Pittsburgh iron people, have a group of eleven patented claims which join the Copper Queen group on the southwest. Present development consists of a shaft 850 feet deep, with about 2000 feet of drifting and other work on the 750 and 850-foot levels. Incidental to this development about 2000 tons of oxidized ore have been hoisted that runs an average of 7% copper, with small values in gold and silver. The ore body has a north-south trend, following the course of a porphyry dike. It has a dip to the south along the bedding planes of the porphyry. The ore shoots lie off the porphyry dike in a dolomite lime formation. The intention is to sink to 1000 feet within the next month or two. In the adjoining Copper Queen grounds the workings have reached the sulphides, and the Calumet Co. expect to reach the same character of ores, but at greater depth than that at which they were found in the Copper Queen. Supt. I. L. Merrill states that the company will undoubtedly erect a smelting plant this season. The underground work is in charge of Foreman E. McFarland. The stock is being floated in Boston at \$10 per share.

The Cochise Copper Co.'s group of fifteen claims lies southeast from the Copper Queen, on the north side of the gulch. Development is in progress, the main shaft being 325 feet deep. It is expected to reach the ore body at 600 or 700 feet depth.

Bisbee, March 19.

The Mammoth mines, Johnsville district, 20 miles west of Wilcox, are reported sold for \$200,000 to Eastern parties.

#### COCONINO COUNTY.

C. H. McClure of the Eastern Star mine says that a large body of smelting ore has been uncovered.

#### GILA COUNTY.

A. P. Campbell, in charge of the Howle group of copper mines, near Globe, is preparing for development work. A 500-foot tunnel will be started at the base of the hill on the Wetumpka claims, to cut the main ledge.

#### MARICOPA COUNTY.

Four miles from Wickenburg, the Oro Grande is reported to have unusually rich gold ore.

The Phoenix Reduction Co. has been organized to build a new smelting plant at Phoenix to smelt ores with crude oil instead of coke.

#### PINAL COUNTY.

The Ray mine is well developed, uncovering a ledge of quartz-porphry, rich in copper glance, the concentrates running 30% to 40% copper. The property includes a large concentrating mill. The chief difficulty which resulted in the property closing down a short time ago appears to have been a lack of satisfactory power to operate the mill. The Ray is 45 miles northeast of Red Rock, on the S. P.

#### SANTA CRUZ COUNTY.

The Mowry mine, which belongs to A. Steinfeld of Tucson, was located and opened by Lieut. Mowry in 1857. Its location is about half way between Harshaw and Washington camp, 12 miles from Patagonia. A 300-foot shaft sinks on the vein foot wall, from which drifts are run at the first, second and third stations. The vein matter is a contact between granite and lime and runs 100 feet wide in places. The ledge has an east-west trend and has a dip of about 45°. The ores are a clean lead-iron carbonate, carrying good values in lead and silver. It contains no zinc nor copper and only a small percentage of silica, hence makes a very clean concentrate. The iron is in excess of the silica, and the premium on the former overbalances at the smelter the penalty on the silica and the treatment charges. F. E. Willson, formerly at Keswick, Cal., is Supt.

The Hardshell mine, which belongs to the Patagonia M. Co., is located near Harshaw, 9 miles from Patagonia. R. R. Richardson is one of the principal stockholders, J. C. Smith being superintendent and J. M. Bandarraga foreman. The mine is opened through a 400-foot incline

shaft, which follows the foot wall, cutting under the ore body. Drifting and stoping have been extensively done on the 100, 250 and 300 foot levels, and the immense chambers that have been cut out in various places show the ore to exist in large bodies in an irregular formation. The appearance of the dump shows that only a small amount of waste has been taken out. The vein matter is pretty thoroughly oxidized and decomposed, the values comprising a lead carbonate and silver. Here and there, however, there are streaks of hard quartz and bunches of galena. About forty-five tons of ore per day are mined and milled, the mill being equipped with crusher, rolls, revolving screens, hydraulic mixer, elevator and concentrating tables. About ten tons a day of concentrates result. The mill tailings are being impounded, and it is the intention to cyanide them. It is presumed that about 10,000 tons have accumulated.

Wm. T. Powers is developing a group of claims in the Santa Ritas, 12 miles west of Patagonia. The work he has done discloses a ledge of lead and copper sulphide, assays from which ran \$8 gold, 24 ounces silver, 10% copper and 20% lead. His work consists of a 170-foot tunnel, which crosscuts to the vein at 160 feet depth, and there is some drifting. He has six claims extending along the strike of the ledge.

Patagonia, March 20.

The Pride of the West property is at Washington camp, 20 miles southeast of Patagonia station. It is about the same distance from Nogales. The property comprises the mines, which produce a lead, copper, zinc and iron ore; a mill equipped with crushers, rolls, roasters and concentrators, and a matte smelter of one reverberatory furnace. The ore, after being crushed to 8-mesh, passes through cylindrical revolving roasters, thence through Wetherill magnetic separators, of which there are two. These magnetic machines make a separation of the copper material from the zinc-lead quartz. The copper consistency is conveyed to the reverberatory smelter, in an adjacent building, from which a 50% matte is produced. The zinc-lead material, or tailings, from the magnets passes to Wilfley concentrators, the product being a lead concentrate that is shipped to a lead smelter. The production amounts to about five tons of copper matte per day and three tons of concentrates. By a system of steam condensation the use of water is greatly economized. Only about 6000 gallons of water per day is used by boilers and concentrators. The mine is developed through tunnels and winzes, the ore being trammed from mine to mill in cars. The property belongs to Colorado parties, Messrs. Wilfley, Gee, Smith and others being interested.

In the same locality is the Duquesne group, which is in control of the Westinghouse interests. It comprises large surface holdings, with quite extensive underground development, whereby large bodies of iron, zinc, copper and lead sulphides are disclosed. The property has not operated for some time, though 200 tons of ore were recently shipped to Pittsburgh for testing. A smelter is projected, with the view of operating the property on a large scale. The ores here are low grade, but in large bodies, copper being the preponderating value. The property is well equipped with hoisting and compressor machinery and good buildings.

Washington, March 27.

### CALIFORNIA.

#### ALAMEDA COUNTY.

Seven miles from Livermore the Fifteen-Three Oil Co. is drilling for oil; the hole is now 560 feet deep. The formation is blue sandstone.

#### ALPINE COUNTY.

Ten feet solid snow is reported at Blue Lakes.

#### AMADOR COUNTY.

At the Free American mine, 6 miles east of Sutter Creek, W. Dennis is sinking the Tucker shaft to drain the other two. Supt. J. R. Tregloan is taking out ore from different levels of the South Spring Hill mine at Amador City.

The Argonaut mill is idle; the mine is kept open and prospecting work is being done.

At the Centennial mine, near Drytown, Supt. Gross is doing development work.

At the Keystone mine, Amador City, the 40-stamp mill is running; the new shaft is being sunk.

The Mutual mine, near Sutter Creek, is to resume.

The shaft of the Gover mine is now unwatered to a depth of 600 feet.

The Prince mine, near Plymouth, is bonded to San Francisco men.—The Kirkwood shaft is being sunk 80 feet per month.

Supt. W. A. Prichard of the Keystone mine, Amador City, is figuring on a new 60-stamp mill.

#### CALAVERAS COUNTY.

A strike is reported at the J. J. Brown property near Campo Seco.

An additional 100 feet will be sunk in the Birdena mine at Campo Seco.

The dam for the Alta mine, at Copperopolis, is finished.

The Ilex mine at Rich gulch is being reopened. J. O. Stewart has charge.

T. F. McArde has sold to J. Shearer of San Francisco the Soldier Gulch quartz mine for \$13,000 cash. The property is 1 mile south of Robinson's Ferry, on the Stanislaus river.

E. K. Stevenot has charge of the operations of the Baltimore Mining & Development Co., and will do considerable active development near Chaparral Hill, Carson district; this season.

#### EL DORADO COUNTY.

Near El Dorado the Shaw mill is in constant operation. The Union shaft is now unwatered.

The River Hill Co. has holdings at Poverty Point, 1½ miles north of Placerville, where a three-compartment shaft is sinking to tap a ledge east of it at a depth of 1000 feet. One hundred and fifty feet from the shaft will be built a 20-stamp mill; consulting engineer for mill work, E. H. Benjamin. Four thousand feet of pipe is being laid. Thomas Clark is superintendent.

#### KERN COUNTY.

Near Bakersfield, Eaton & Bell have sold to the Pacific Petroleum Co., Ltd., the Edith B. and Cupper Creek mining claims, with the understanding that the petroleum company commence work within ninety days drilling a well until oil is found, or until a depth of at least 1000 feet has been reached.

The Yellow Aster at Randsburg will be sunk to the 1200-foot level.

In Kern River district there are now 241 producing oil wells, each sending out from 25 to 500 barrels per day. These wells are from 600 to 1400 feet deep. The oil feed is about 700 feet above sea level. The oil is delivered in San Francisco for 80 cents per barrel; freight 42 cents per barrel, in tank cars, each carrying 155 barrels. Lack of cars keeps down production: a pipe line, westward to the coast or northward to San Francisco, is projected. At the wells the oil sells for from 25 to 40 cents per barrel. Its present use is almost entirely for fuel purposes. The S. P. R. R. Co., and San Francisco and Stockton manufacturers are among the largest consumers.

The Kern River Oil Co. is reported to have sold 20,000 barrels of oil to the Standard Oil Co. at 25 cents per barrel.

#### LOS ANGELES COUNTY.

Oil is 85 cents per barrel on the cars at Los Angeles; at the wells from 70 to 80 cents. The output is undiminished.

The Central Oil Co., Whittier, has 11,000 barrels of oil stored, and is adding to the supply. The Standard Crude, Whittier, is 830 feet down.

#### MARIPOSA COUNTY.

Work on the Nameless mine, in Whites Gulch, has been discontinued. The parties operating this property had it under bond for \$10,000; the bond expired last week. The company desired an extension of the bond, but the owners would not consent, so operations have stopped.

#### MONO COUNTY.

In the Standard Con. mine at Bodie for the week ending March 16th 337 tons of ore were crushed; average assay vanner tailings, \$7.79; concentrates produced, 76 tons; assay value, \$82; amalgam produced, 1068 troy ounces; value per ounce, \$2.05.

#### MONTEREY COUNTY.

A "gusher" is reported struck on the Tomboy claim, San Ardo, 65 miles southwest of Salinas, at a depth of 1140 feet. There are five companies operating in that vicinity.

#### NEVADA COUNTY.

The Niagara mine has a ledge 2½ feet in width showing free gold. A 5-stamp mill will soon be started.

The Jackson copper mine at Spenceville is bonded to Eastern men.

Supt. P. Tautphaus has fine ore in the Providence mine, on the 1800-foot level; the ledge is 6 feet wide.

The Nevada County mine, on Deer creek, is bonded for \$10,000 to Whilden, Marvorich, Calahan, Rood and Hawkey. Machinery will be placed on the mine and the property drained.

#### PLACER COUNTY.

A new 10-stamp mill will be put in by the Washington Quartz M. Co. at Bath.—H. F. Calenberg has sixteen men working at the Jupiter gravel mine.

#### PLUMAS COUNTY.

At Genesee, S. E. Swearingen has men employed in the Reward mine sinking on the copper ledge.

At Laporte, G. F. Mahon, Supt. Dutch mine, has water to the mine and is piping

gravel.—Packer & Son, owners Alturas mine, on Slate creek, are working several men.—The Thistle is piping the tailings.

#### RIVERSIDE COUNTY.

Ferris reports that the Santa Rosa gold mine, has been sold to Denver and Los Angeles men, who will unwater the property.

At the Red Cloud mine, 30 miles from Salton, fifty men are employed; a 100-ton smelter has been erected. In the same district two 10-stamp mills have been completed.

#### SAN BENITO COUNTY.

Cinnabar is found near the New Idria. J. C. Christenson says the ledge occurs between walls of sandstone and serpentine, with a gangue of black alta. The find is 3 miles from Tres Pinos.

A depth of 930 feet has been reached by the San Benito County Oil Co. The drill is going through blue shale.—The rig of the Grant Oil Co. on the Topo has been turned over to the company by the contractor. Drilling will begin at once.—The San Carlos Jr. Oil Co. will begin operations on its property as soon as teams can get their material on the ground.—There are forty-seven oil rigs in operation in San Benito county.—The Fresno-San Benito Oil Co. has shut down owing to an injunction granted to a scripper. The company will put up bonds and go on drilling.—A. Leonard has bonded the Aurora & Mollie O group of quick-silver mines, near Hollister, to G. Senn of San Francisco for \$22,000.

#### SAN FRANCISCO COUNTY.

The California Petroleum Miners' Association, discussing freight rates, say:

We who are at present producing oil in the Sunset, McKittrick, Coalinga and Kern River districts would certainly feel injured if new oil discoveries were made say, for instance, in the neighborhood of Mount Diablo, and the producers be enabled to railroad their oil into San Francisco at such rates, based on distance, as would shut out oil in the districts named. If the rate is uniform, no new discovery, no matter how near the point of consumption, could bar the oil in localities more remote. The actual cost of transportation of a car carrying from 150 to 175 barrels of oil is, when loaded, 3 cents per mile per car. In view of the fact that the grade from our California oil fields to San Francisco is down grade it is reasonable to suppose that the cost here is less than the 3 cents per mile above mentioned. But taking that as the actual cost to the railroad companies, then the cost of transporting a car of oil from Bakersfield to San Francisco, a distance of 312 miles, would be \$9.36; and allowing the same rate in returning the empty car the total cost would be, from point of shipment to destination and return, \$18.72, whereas the charges now are from \$63 to \$73.50 per car, according to the number of barrels carried. When oil was first discovered it was selling at \$2.50 per barrel, and the freight charge was from 62 cents to 65 cents, about 25% of the selling price of the oil. When the price of oil fell to \$2 and \$2.10 per barrel, the railroad of its own accord reduced the transportation charges to 52 cents per barrel. When the price of oil was reduced to \$1.60 or \$1.70 per barrel, the transportation rate went to 42 cents per barrel, at which it has since been maintained, notwithstanding the price of oil has greatly fallen. It will be seen that the railroad charges have been always in the neighborhood 25% of the selling price of the oil, and the present rate should be reduced accordingly.

#### SANTA CLARA COUNTY.

Oil development work near Gilroy is active. There are twelve derricks in operation.

#### SHASTA COUNTY.

The Harrison copper claims on Upper Cow creek are reported bonded to J. W. Turner of Eureka for \$45,000 till November 10, 1901.

At Jersey City, N. J., the Ruby Hill Copper M. & S. Co. has incorporated with a capital of \$2,500,000; incorporators—W. W. Cromwell, W. J. Curtis, H. B. Parsons, G. H. Sullivan, H. W. Clark. It is locally stated to have acquired a copper mining property at Copper City said to be partially developed; J. R. DeLamar is reported to be the principal promoter.

The London Tunnel Co.'s group of seven claims on Mule mountain has been bonded by F. M. Archer for \$40,000.

#### SIERRA COUNTY.

A carload of pipe and a carload of steel shoes and dies have arrived at the Gold Bluff mine, Downieville; W. H. Copeland, Supt.

At the Four Hills mine thirty-five men are laid off while the shaft is being deepened.

#### SISKIYOU COUNTY.

The pocket found by S. Schliski, Graham gulch, near Cecilville, is said to be unusual. He took out \$15,000 and then

old Orcutt Bros. of Yocumville that he had all he desired and gave them the location of the pocket. Since Schiski gave it to them, they have taken out about \$4000 and have not gotten to the bottom of it yet. Schiski bought this claim from McInnis Bros. for \$10. They had taken out pocket of a few hundred dollars within 10 feet from the pocket found by Schiski. Two pocket prospectors ran the trace up the pocket a few days before Schiski went to work on it; but as they could only get a few small colors to the pan, they concluded that it was not worth their time to dig on the seam. Before Schiski had gone down 3 feet he had a seam of early pure gold 5 feet long.

The copper mine on Moffitt creek, near Fort Jones, formerly owned by Loftus Ross, is being operated by T. J. Henderson.

Cherry Creek is a lively mining locality, the placer and hydraulic claims being worked with full force, also the Cherry quartz mill and mine.

The Siskiyou Hydraulic M. Co., at Calhoun, B. Boyer, manager, has nearly 100 men employed on preparatory work for two large hydraulic plants—one on South Fork and the other at Wild Cat. They have one claim in operation under the management of J. O. Rusby.

The Consolidated M. & D. Co. has bought up river bottom land near South Fork and are working two claims by hydraulic process; they will build a dredger.

E. H. Wallace will shortly resume work at the Phillips & Cartwright mine at Humburg. At the Bull hydraulic mine, above the forks of the Humburg, hydraulic mining has begun. The 10-stamp mill at the Dewey mine, in Gazelle district, is running steadily.

#### TCOLUMNE COUNTY.

The new 5-stamp mill at the Prudhomme mine, near Carters, is in operation.

At the Santa Ysabel mine prospecting and new development work begins in shaft No. 3. Two thousand feet of air pipe are laid, connecting the compressors with the shaft, to convey power for operating the drills. An electric hoist is at the mine.

The Republic mine, near Carters, is sold for \$15,000.

In the new chlorination plant at the Sawmut mine the furnace uses oil for fuel. A new 10-stamp mill is going in at the Densmore mine. At the Mt. Lily mine the 5-stamp mill is in constant operation.

The Arbona mine, near Sonora, is to have air compressors and power drills; shafts will be started north and south; the main shaft is down 612 feet.

#### YUBA COUNTY.

Suit has been filed in the U. S. Circuit Court for condemnation of lands in this county to be used as the sites of impoundment barriers. One of the terms by which the Federal authorities have taken hold of the matter is that the dam sites and selling reservoirs shall be in the name of the United States Government, and it is to meet this condition that the suit has been instituted.

#### COLORADO.

State Senator S. I. Hallett of Pitkin county, and others, succeeded in preventing in the Legislature last week a wholesale taxation of mine products, the revenue bill, as passed, taxing one-fourth of the output.

#### ARAPAHOE COUNTY.

Warne has brought suit against Winchester & Stevenson, the Doctor and Chas. M. & L. Co., A. E. Carleton, et al for \$125,230, which he claims as his share of the Doctor mine of Cripple Creek, based on an allegation that J. Winchester, the discoverer of the mine, was grubstaked by the plaintiff, and that, acting in sue capacity, he expended \$6500, and was promised an undivided half interest in the mining property that the defendant Winchester secured.

#### BOULDER COUNTY.

Eldora the Enterprise mine has been leased to Mrs. E. Richardson of Denver for \$50,000.

Boulder the first payment of \$2000 is made by the Golden Age M. Co. to T. Mergersdorf for a group of claims in the Sun Loaf district, bought for \$16,000. The property will be worked under the direction of J. S. Krum. The company owns the Tenderfoot, near Sunshine.

The El Moro group of mines at Jamestown is reported sold for \$14,000 to E. J. of Boulder.

The Creston Golden Eagle M. Co. sold the Golden Eagle mine at Salina is doing development work. Man Fitzgerald hopes to see the mine on a dividend paying basis.

#### CHAFFEE COUNTY.

In the Twin Lakes district the Simons group, on Miner hill, is sold for \$24,000 to

L. M. Turner of San Francisco. Mr. Turner expects to put a road to the mine and begin systematic development.

#### CLEAR CREEK COUNTY.

Twenty-four patented lode claims in Cascade mining district have been sold to the Victor Con. G. M. & Tunnel Co., composed of Denver and Boston men; E. C. Gard of Denver is president. The properties comprise a compact body of gold-silver lodes. A double-track tunnel will be driven 2000 feet to cut these properties at great depth.

Interests in placer ground properties from Idaho Springs to Floyd hill, 8 miles, are consolidated in one large company. A 7000 H. P. plant is projected on Gold Bar, near Floyd hill.

#### EAGLE COUNTY.

The Eagle Bird T. & M. Co. is incorporated; capital stock, \$100,000; W. S. Cheesman of Denver, president.

#### FREMONT COUNTY.

At Florence a strike was threatened at the plant of the Rocky Mountain smelter. A committee from the local Smeltermen's Union presented a new scale to Manager Danforth. The demand for an increase in wages in the different departments ranges from 20% to 50% more than paid at the Pueblo and Canyon City smelters. The manager said he could not pay any greater wages and earn enough to pay expenses.

The coal miners at Rockvale have called off the strike on the property of the Colorado Fuel & Iron Co., which had been on the last ten weeks. The company granted concessions to the miners, who will receive 75 cents a ton of 2000 pounds the run of the mine; formerly they received \$1 a ton for lump coal only. The miners are also to have a check weighman, whose salary will come from the employees. The company also agrees that no blacklisting will be done among union men. Work will be resumed in the mines of Coal Creek, Rockvale and Brookside, where about 1500 men have been out.

The Cotopaxi ore goes 28% copper. The property is 6 miles from Howard, on the Denver & Rio Grande Railroad, and is owned by the Cotopaxi Co.

#### GILPIN COUNTY.

Near Central City is the Scandia mine in Illinois-Central district. The shaft is over 650 feet deep. Yellow and gray copper ore is being piled up for shipment.

The East Boston mine, in Central City, will have a shaft 500 feet deep.

The shaft on the Annex mine, in Lake district, will be sunk 400 feet.

#### GUNNISON COUNTY.

The Dubois tunnel, the property of the Dubois T., M. & M. Co., S. L. Ely secretary and G. W. Griffey general manager, Dubois, has a tunnel now in 1070 feet, which is being driven to tap the Pride of Denver vein, which is 30 feet between walls. The tunnel is to cut it at a depth of 450 feet. It will be reached by the tunnel at a farther distance of 230 feet.

#### LAKE COUNTY.

The Leadville scale of wages is now established at \$3 per day.

From Leadville A. Davis has sent 500 tons zinc ore through Jacobsen & Co. for the European market.

At Leadville the Banker M. & M. Co. of New York, on Brece hill, is developing between the 200 and 1100-foot levels in the Banker shaft. Manager Guth expects to make a copper mine of it.

At Leadville the Small Hopes M. Co., S. W. Mudd, manager, has voluntarily raised the wages of the miners from \$2.50 per day to \$3 per day.

The daily output from Leadville district averages 2500 tons.

A pumping feat was successfully accomplished at the Revenue No. 1 shaft one afternoon recently, says the Leadville Herald-Democrat. When the steam was first raised in the boiler the station pump was under 80 feet of water at a depth of 400 feet, while the sinkers were 60 feet farther below. The station pump and sinkers had been recovered, and active mining has commenced in the lower drift along the first contact. Under ordinary circumstances this work would require several weeks, but a little ingenuity enabled the work to be done in less than three days. When work at the Revenue closed last year the pump was carefully overhauled, check valves placed in position and the mechanism given a good dose of oil. It was Manager Estey's idea that, with this careful preparation, the pump could remain under water for a considerable length of time, and when operations were to be resumed all that need be necessary would be the turning on of the steam. When the practical test was made it was a success. The steam shot down through 80 feet of pipe, which was surrounded by the cold water. There was, of course, much condensation at first, but presently a movement could be discovered. Eighty feet below, buried beneath the water, the ponderous mechanism

began moving, and presently the water began to pour out of the pipe. As the machinery became warmed to its work the strokes increased, and 300 gallons a minute were flowing to the surface; the third day the sinkers had been recovered and the lower drift drained of water.

#### MINERAL COUNTY.

The erection of the Big Kanawha Co.'s 300-ton concentrating mill at Creede has begun.

#### OURAY COUNTY.

At Ouray the Camp Bird mine and mills give employment to 400 men and the wages average about \$4 per day. Besides twelve or fourteen six-horse teams hauling ore from the mine to the mills, there are a number of pack trains similarly engaged. The total expense of conducting operations there is estimated at \$2500 a day.

#### PARK COUNTY.

The Dakota group, Pennsylvania mountain, Alma district, will be worked by the Bonanza G. M. & M. Co. and new machinery put in.

#### PITKIN COUNTY.

At Elko, on Rock creek, the tunnel will be started next month to run 3000 feet into Galena mountain. It will be 8x7 feet in the clear. The large mill will be completed and in operation June 1.

Notice of application for patent of the largest group of claims ever surveyed for patent in the United States, comprising sixty-four claims on Islet mountain, in Quartz Creek district, the property of A. E. Reynolds, appears in the Pitkin Miner this week, occupying one page of that paper.

#### RIO GRANDE COUNTY.

At Summitville forty men are at work; 180 tons of copper ore have been shipped.

#### SAN JUAN COUNTY.

At Silverton the Hercules M. Co., Manager T. Kane, will extend the drift on the vein in the Empire tunnel to run under the ore shoot in the upper workings on the Montezuma tunnel. Thirty-five men are employed. As soon as the mill is put in operation the force will be increased to seventy-five.

The Eureka Exploration Co. has purchased a group in Burns gulch and the Silver Wing mill. The Frederica is the principal claim of the group. Another property owned by the company is the Scotia group, in Picayune gulch. The company proposes to erect an electric power plant on the Animas below the Ridgway for the generation of power for operation of electric drills, and also to connect the mines of its Burns gulch group with the Silver Wing mill by an aerial tramway.

The San Juan M. & D. Co., A. P. Ptolemy, Supt., is pushing work on the Silver Queen, Arrastra gulch. The Silver Queen tunnel is designed to cut five separate veins.

#### SAN MIGUEL COUNTY.

The Smuggler-Union Co. will not build a new mill on the Contention mill site near Telluride. An addition of forty stamps will be made to the old mill at Pandora. A gravity tram will be run from the Contention group, giving the two plants 160 stamps.

A New York company has been organized to work the Keystone placers.

#### SUMMIT COUNTY.

At Breckenridge the Iron Mask G. M. Co. has incorporated, to sink a deep shaft on their property, 1 mile from Breckenridge.

#### TELLER COUNTY.

The driving of the last spike on the Colorado Springs & Cripple Creek Short Line Railway was celebrated at Cripple Creek last Saturday.

The Bertha B. claim, on Raven hill, is sold to the Palo Alto G. M. Co., a new corporation, for \$100,000.

Sylvanite ore is found in the Hummer lease, block 8 of the Gold Bond Con. Mines Co., Gold Hill; about 4 feet of pay value.

At shaft No. 2, 820 feet deep, a 30-drill compressor will be put up by June 1.

Work has resumed on the Jolly Tar, south of the Strong mine, Victor. The property has a 500-foot shaft and several hundred feet of drifts and crosscuts.

At Victor the double compartment shaft on the lower end of the Orphan Belle will be sunk by the Isabella people to a depth of 800 feet.

A local report says that fifteen tons of ore taken from the deepest workings, 1050 feet, of the Last Dollar mine at Victor have been shipped to the smelters, and that it is estimated to contain about \$2000 per ton.

#### IDAHO.

#### BLAINE COUNTY.

H. L. Hollister of the Golden Star, Hattie and Jumbo group of mines of Hailey has, through Supt. Allen, made four loca-

tions appropriating 3900 cubic feet of the waters of the Malad and Big Wood rivers, to be used at the points of appropriation for electric generation of power and light for those properties.

#### BINGHAM COUNTY.

The Union Pacific and the White Knob Copper Co. have a contract for 100 miles of railroad from a point near Blackfoot to Houston, Custer Co.

#### ELMORE COUNTY.

C. T. Brockman, general manager Sawtooth G. M. Co., Rocky Bar, says the 20-stamp mill, commenced last year, will be completed this season.

#### FREMONT COUNTY.

H. Kerty has organized a company at La Belle to work Snake river gold-bearing sand by an electrical device.

#### IDAHO COUNTY.

The Jerico M. & M. Co., Seattle, Wash., has incorporated to operate the Dewey mine; C. A. Marriner, manager.

W. D. Boyer, manager Gold Point Co., Red river, Dixie district, projects plans for a new 60-stamp mill.

The Idaho-Comstock Co. of Dixie has been reorganized, capitalization \$500,000; W. H. Phelps, manager. The property includes five claims and shows some rich free-milling ore. About 4000 feet of underground work had been done at the time of the shutdown; the owners will spend money in development this summer.

#### SHOSHONE COUNTY.

At Wallace W. T. Hales has bonded the Panhandle group for \$50,000 and proposes to begin work April 1.

The U. S. mine, near Wardner, is yielding gray copper ore carrying 523 ounces silver per ton and 26 1/2% copper.

In the Cœur d'Alenes are ten concentrators in operation, which handle between 4000 and 5000 tons of crude ore daily, producing about 600 tons of concentrates. At the same time it is estimated that 125 tons of ore, carrying 66 tons of lead and 4200 ounces of silver daily, go into the South Fork of the Cœur d'Alene river, the gross loss being \$8000 per day, 300 days in the year, so that every year \$2,400,000 is lost in the slimes from that district alone; deducting freight and smelter charges, the operators are out nearly \$2,000,000 per annum. About the best results that have been attained there are the saving of 85% of the values.

At Wallace the crosscut on the Stevens peak has crossed 57 feet of the ledge without showing the opposite wall. At Wallace the Mammoth M. Co. has the longest crosscut tunnel in the Cœur d'Alenes—3475 feet from the portal to the point of intersection of the vein.

Eastern reports are to the effect that the American Smelting & Refining Co. is negotiating with Cœur d'Alene producers of lead to bring about a reduction in the production there for six years, which, if so, would indicate that the decline in American consumption of the metal has been such as to make the holding of the lead market at present prices onerous to the company.

#### WASHINGTON COUNTY.

Manager Reed at Cuprum has been developing the Mineral World mine, owned by the Inca M. & M. Co. The ore carries silver bromide, fifty ounces per ton, and 10% copper. Council, the present terminus of the P. & I. N. Railroad, is 38 miles from the mine.

#### MONTANA.

The two new State laws affecting mining locations have been signed by Governor Toole. One provides that the work must be done within sixty days after the location is made instead of ninety, as formerly, and the erection of monuments must be done within thirty days after location. The other law provides for the filing of an amended declaratory statement—if at any time the locator shall find his first location was defective, he desires to alter his boundaries, or for any other reason, except that such amendment shall not work a forfeiture of the rights of others.

#### BEAVERHEAD COUNTY.

J. J. Cusick, manager Polaris mine, near Dillon, will build a new mill.

On August 29, 1900, after a run of twenty-five days, the furnace at Glendale was closed down and the Hecla Con. M. Co. began shipping its product to Omaha. The following summary covers shipments from September to December, inclusive:

|             | Cars. | returns.    | Expenses.   |
|-------------|-------|-------------|-------------|
| September.. | 6.... | \$ 8,681 06 | \$ 8,596 76 |
| October.... | 5.... | 13,182 29   | 8,452 08    |
| November..  | 5.... | 9,254 82    | 9,305 59    |
| December..  | 8.... | 15,287 34   | 9,815 12    |

Totals..24....\$46,405 51 \$36,169 55  
Net profit, four months, \$10,235.96.

#### BROADWATER COUNTY.

The Stolen Sweets mine at Winston is sold to Barton Sewell, general manager

American Smelting & Refining Co., for \$15,000.

#### GRANITE COUNTY.

At Garnet the Mammoth and I. X. L. mines have put on additional men.—The Grant & Hartford mine has been bonded to Mullen & Hornbrook of Butte for \$25,000.

#### JEFFERSON COUNTY.

J. Henry Longmaid has let a contract for rebuilding and repairing the mill buildings of the Elkhorn mine. Elkhorn will be a lively camp this summer.

#### MADISON COUNTY.

A strike is reported from the Sunshine mine in Argenta district, ore assaying 155 ounces silver and 29% lead to the ton. The mine is close to the old camp of Argenta, 14 miles from Dillon.

Four miles from Meadow Creek P. O. is the Madisonian mine, a three-compartment 450-foot shaft with a 45° incline. At every 100 feet there is a crosscut to the lead and drifts on the lead in every direction. Sixty-eight men are employed in the mine and mill at the present time with E. J. Trerise superintendent. The ore carries iron pyrites and copper, and the slimes carry as great values as the pulp. It can be treated successfully by the process now in use down to the 300 level, but at the 450, so far as shown by tests up to the present time, it becomes a concentrating and smelting proposition. It is the only mill in the State that precipitates with sulphuric acid; after precipitation the solution carries but a trace of gold.

#### SILVER BOW COUNTY.

Butte reports that on the 25th inst. the Nipper mine, another of the properties involved in the Heinze litigation, was closed down and 250 more men thrown out of employment as the result of the decision of the Supreme Court that the appointment of a receiver by the District Court was wrong. That makes the fifth shutdown within a month through the same cause, and about 1000 men are laid off as the result.

#### NEVADA.

##### ESMERALDA COUNTY.

At the new camp of Tonapah miners are paid \$4 per day of eight hours.

##### HUMBOLDT COUNTY.

P. C. Ostrander reports a strike at Trinity, the ore running \$200 to the ton.

Under the management of M. M. Baruh, the sulphur mine at Humboldt is now on a paying basis.

##### LANDER COUNTY.

The Nevada M. Co., at Berlin, 60 miles south of Austin, has a 30-stamp mill operating on gold ore.

##### LINCOLN COUNTY.

Sinking and drifting are in progress on the Ninety-nine mine; last car lot of ore averaged 30% Cu and netted \$1500 to the owner, C. M. Over.

T. Ewing is pushing work on a copper prospect near the Potosi mine.

Walter Carter, Supt. of the various claims lately purchased by Los Angelinos, is pushing work on all of them.

Development work is pushed on the Boss, a gold and copper property; Supt., J. Connelly.

C. A. Beck will work the Vulcan group, a gold-copper proposition in the north-eastern part of San Bernardino county, Cal.; surface assays: gold, \$4; copper, 27%; silver, two ounces.

The Barefoot group (gold mines) are being surveyed for patent.

Development on the Green Monster shows large and continuous ore body—gold, copper and silver; J. Wilkinson, Supt.

Good Springs, March 24.

The Half Moon mine, at Pioche, put forty men to work last week.

##### STOREY COUNTY.

Supt. Ryan reports to the Comstock Pumping Association from Virginia that the water is 198 feet 6 inches below the 1950-foot level station.

##### WASHOE COUNTY.

At Reno the Star mine ore is sorted into three grades, sacked and piled in the ore house.

##### WHITE PINE COUNTY.

A \$100,000 plant to treat the ores of the Chairman M. Co. at Ely will be in operation Oct. 1.

The Chairman M. & E. Co. has acquired the property of the Chairman Co. at Ely for \$150,000.

##### NEW MEXICO.

##### GRANT COUNTY.

The Virginia mining district, from 2 to 5 miles south of Lordsburg, is the center of considerable activity, where development has uncovered good bodies of iron and copper sulphides, carrying gold, silver and copper values.

The Superior group, about 2½ miles from town, belongs to El Paso parties,

who have sunk a 400-foot incline down the dip of the ledge. They struck water and heavy sulphides at 334 feet, at which level they have done some drifting. Shipments of the ore to El Paso brought returns of about \$20 gold, 15 ounces silver and 8% copper. It was necessary to put in a pumping plant to handle the water.

The Eighty-five group, belonging to the Shakespeare M. Co., is being reopened, with the intention of erecting a concentrating plant. The headquarters of this company are in San Francisco, Jno. Leechman being president. Shipments of fifty cars of ore from this property some time ago are said to have run \$400 to the car. It is claimed they have 6000 to 7000 tons of concentrating ore on the dump that will run \$10 per ton.

The Orion, in the same district, is under the management of A. W. Gifford. This mine is fairly well developed and is a shipper. It is stated that shipments have returned a sufficient amount to pay for half of all the development. A shaft sinks 175 feet on the vein, from which levels in ore are run every 50 feet. They have a large tonnage of ore blocked out and development is in progress. The 5000 tons of ore on the dump, it is estimated, will run \$12 to \$18 per ton. The Orion Co. contemplate putting up a concentrating mill.

The Aberdeen Copper Co. of New York, of which R. H. Batchelor is manager, recently purchased twelve claims in the district, which are being developed. A good body of ore was struck in one shaft at 75 feet depth. On another claim a strong flow of water and sulphide ore was encountered at 60 feet depth. In this case the ore was a copper-lead sulphide, the lead being a galena, all carrying gold and silver.

Speaking generally for the camp, the ores are well suited to concentration. Mining, sorting, hauling to railroad, freight to El Paso and smelting charges aggregate about \$20 per ton, hence only ores running as high as \$30 to \$35 per ton are shipped, the lower grades being piled up on the dumps for prospective concentrator work. Coal here costs \$8 per ton in car lots, wood \$4 per cord.

A cyanide plant and crushing mill are to be put up at Gold Hill, 12 miles northeast of Lordsburg, to operate on ores that carry flour-fine free gold. The property was sold by C. W. Maxson to an English company, and H. Wyndham of London will be in charge. WASCOTT.

Lordsburg, March 23.

The Wilson M. Co. recently purchased the Volcano group, located 7 miles north of Stein's Pass, on which they have erected a 10-stamp mill and other buildings. They also put in a 5-mile water line, which furnishes water for the camp. Their ore is free-milling.

The Mineral Mountain M. Co. have eleven claims, having an outcropping that shows green copper carbonates on the main ledge and iron pyrites carrying silver and gold in a cross vein. There are various veins that appear to converge into one. Development is in progress, a 200-foot shaft in ore and a vein tunnel having been driven, with a considerable amount of drifting on the vein from the shaft. This work shows the vein to be about 7 feet wide. The work has developed a good supply of water, which is considered important. On another portion of the group is another 100-foot shaft, with drifting on the vein. It is estimated that 27,000 tons of ore are blocked out which will average \$15 per ton. C. W. Maxson of Lordsburg is manager.

Stein's Pass, March 24.

##### RIO ARRIBA COUNTY.

On the 25th inst. the new reduction plant of the Copper Hill M. Co. was completely destroyed by fire; the boiler house and tank were also destroyed; loss, about \$75,000, at Rinconada.

##### SANTA FE COUNTY.

A mill is to be erected at Dolores to operate under the Edison invention for the dry washing of gold gravel.

The Cochiti G. M. Co. has increased the capacity of its mill at Albemarle by the addition of seven 70-ton tanks. It is also credited with intention to build a large new mill at Bland. The new stamp mill at Allerton is completed.

#### OREGON.

##### BAKER COUNTY.

Baker City will add \$500 to the amount allowed by the State commission for a mineral exhibit at the Buffalo Exposition, a total of \$2500.

W. Smith and Allen Bros. have sold the Don Juan and a three-fourths interest in the Dodo No. 2 mine, in the Robinsonville district, to E. D. Leclaire for \$10,000.

Two more carloads of machinery have arrived for the Quebec mine.

The Little Giant M. Co. of Liverpool, England, are dealing with the owners of the Magnolia mine for its purchase. The

price asked is \$60,000. This property was under bond to W. L. Vinson as representative of the Little Giant M. Co., and several thousand dollars was spent in development work, besides a complete 10-stamp mill was put up on the property.

There is an excellent opening for a sampling works at Sumpter. A large number of the new properties are in a position to ship small lots of ore.

A company has just been organized to purchase and exploit the Grand Trunk ground, lying between the Mammoth and Ibox mines.

The Wisconsin M. Co., east of town, are in 150 feet on the vein with their tunnel. The values are very satisfactory to the owners.

The shaft now being sunk by the Red Boy is down 100 feet. It will continue straight down 2500 feet.

The new plant of the Bonanza is nearly set up. Their electric plant is the largest in the district.

The number of men at the North Pole mine is being increased right along. This is the deepest mine in Oregon and one of the biggest producers, Sumpter, March 26.

A strike is reported in the Racine copper group, 6 miles from North Powder, of three veins within 120 feet of each other—two copper and the third gold.

The Magnolia mine, 4 miles north of Granite, is bonded to C. Bahmford.

Work has been resumed at the Cornucopia mines.

##### JACKSON COUNTY.

F. Mixton of Rock Island, Ill., has bought Shearer Bros.' placer mines, Steamboat district, for \$6000.

##### SOUTH DAKOTA.

##### CUSTER COUNTY.

The mica industry in this county is employing sixty men. The mica free from iron and cut into sheets ready for use brings from \$1 to \$10 per pound, depending upon the size of the sheets. The run of the mine is taken for from \$50 to \$80 per ton. Waste mica brings at the mine \$25 to \$35 per ton; stone mica, \$1 to \$5 per pound.

Custer reports a strike of tin ore in the New York mica mine; the ore shoot is 6 feet in width and runs 5% tin. The mine is owned by Dow Bros., Sioux City, Iowa.

##### LAWRENCE COUNTY.

The Homestake Co. will build a 200-stamp mill this season. When the De Smet at Central City starts, the company will have 900 stamps in operation.

##### UTAH.

##### BEAVER COUNTY.

The O. K. at Milford reports development of ore carrying 60% copper.

R. C. Chambers and associates of Salt Lake have bought a controlling interest in the Copper Ranch Co.—seventeen mining claims, in Rocky district—for \$50,000.

##### BOX ELDER COUNTY.

In Park Valley the Century M. Co. has a monthly output of \$3000.

##### JUAB COUNTY.

The Bingham Co. now has control of the Grand Central mine of Tintic, on the basis of \$2,000,000 for the property, to secure its siliceous ores.

##### PIUTE COUNTY.

At Gold Mountain the Deer Creek M. Co. has 2400 acres of ground adjoining the Annie Laurie and Golden Star. It is the intention to construct a wagon road from Marysvale, a flume and power house, and to follow it with a mill, the latter to be in operation by Aug. 1.

##### SALT LAKE COUNTY.

Upon the completion of the new \$1,000,000 smelter at Murray the Germania will be remodeled and converted into a pyritic smelter, with equipment similar to the Bimetallic smelter at Leadville, Colo.

In the Louise M. Co.'s Bingham property Supt. Garretson has 4 feet of ore exposed in a vein 8 feet between the walls that will average \$56 per ton in gold, silver and lead.

A Utah judge decided this week in a Bingham case that a government mineral surveyor cannot legally locate a mining claim.

Bingham producers are again agitating the project of a tramway to the valley smelters.

##### WASHINGTON COUNTY.

Thirty tons high-grade copper bullion have been shipped from the Dixie smelter at St. George.

##### WASHINGTON.

##### COWLITZ COUNTY.

Kalama, on the Columbia river, reports the discovery of gold-bearing ledges in several parts of the town.

##### FERRY COUNTY.

At Republic the Butte & Boston ore shoot has been found in a raise being

made to connect it with the lower workings of the mine.

The Lorraine C. M. Co. of Hoquiam has bought the Wilnot group on Silver creek, near Keller, and expect to expend considerable money developing the property.

H. P. Heacock will superintend development on the Caledonia, at Keller.

##### OKANOGAN COUNTY.

A million dollars' worth of treasury stock in the Palmer Mountain Tunnel Co. has been sold to investors in London.

The crosscut at the 185-foot level of the Lakeview is in the ledge 22 feet. The hanging wall has not yet been reached.

Work has resumed on the Lisbon.—F. Grogan has organized the U. S. Reduction Co. to operate twelve claims on Little Mount Chapaca; a 1000-foot tunnel will be started.

##### STEVENS COUNTY.

At Colville, the Copper King on Douglas mountain has been bonded for \$60,000.

## FOREIGN.

### AUSTRALIA.

Australasian gold production has increased since 1890, when the total was 1,587,947 ounces. The total for 1898 was 3,547,079 ounces; that for 1899, 4,461,105 ounces. The year 1900 has witnessed retrogression, the total being 4,174,811 ounces, showing a decrease of 286,294 ounces. Nearly every State has produced gold during the past year. The following table indicates the movement in the production of each State for the past year:

|                        | Ounces.   |
|------------------------|-----------|
| New South Wales.....   | 345,000   |
| New Zealand.....       | 371,993   |
| Queensland.....        | 951,065   |
| South Australia.....   | 29,397    |
| Tasmania.....          | 89,000    |
| Victoria.....          | 807,407   |
| Western Australia..... | 1,580,949 |

Total.....4,174,811

### BRITISH COLUMBIA.

The Hewitt Syndicate at Silverton, Slokan Lake, will build a tramway.

On the 1st of January the American smelters refused to contract for any more silver-lead ore from the Slocan mines. Since then rumors have been numerous of mines that would close down; but, so far as known to your correspondent, the Whitewater mine is the only mine to suspend operations through inability to sell ore. They have about 800 tons of concentrates piled along the K. & S. track, ready for shipment. There is more ore in sight, and conditions are better for extracting the same than they have been since the mine resumed operations a year ago. The mill was closed down March 1st and all miners working on ore were laid off, reducing the force from about 110 men to about 30 men.

Sandon, B. C., March 17.

The Highland mine at Ainsworth has closed down. Increased charges for treatment and the low price of lead are the reasons assigned for the suspension of operations.

For the week ending March 9 Rossland broke its ore shipping record, sending out 8591 tons. The largest previous shipment thence in a week has been 7814 tons.

It is proposed to unite the Ward Horsely and Horsely Hydraulic G. M. Companies of Cariboo, the latter company being wound up, the stockholders of the Horsely receiving two shares in the new joint company for each one held in the old one.

The Toronto-Lillooet Gold Reefs Co.'s cyanide mill started on the 4th inst. and is averaging forty tons daily.

The Rossland output for the week ending March 23 was 8160 tons. The correct figures for the year up to and including March 23 are 86,587 tons.

Near Slocan work is to be resumed this season on the Kalispell.

### MEXICO.

The Melzer M. Co. are completing a 200-ton matte smelter at their Copite mines, 25 miles from Carbo station on the Nogales-Guaymas railroad. Carbo is 145 miles south of Nogales. This locality is at an altitude of 2800 feet above sea level, which is supplied with water through a pipe line from the Rio San Miguel, there being a pumping station at the latter place. Mesquite wood is used for fuel in furnishing steam. Shipments of supplies are by water to Guaymas or by rail via Nogales. The ores here comprise iron and copper sulphides, with considerable carbonates and lime, and are self-fluxing. At present about 300 men are on the company's pay roll, and this number will be increased. Most of the mining is done with air drills. The smelter was erected by the Union Iron Works of San Francisco; the furnace is 28x146 inches, and there are extensive flues for saving the values that otherwise would escape in the

fumes. It is expected the plant will blow in next week. A traction engine train is operated between Carbo and the mines. Melezer Bros. and associates are the principals in the enterprise. They have opened an office in Nogales, Arizona.

Carbo, Sonora, March 26.

The Promontorio mines, 28 miles southwest of Nogales, are being developed through shafts, inclines and tunnels. The ores are free milling and concentrating. At present there is a 10-stamp mill on the property, but a new mill will be built this season.

Nogales, Sonora, March 25.

T. E. Levy says that he has closed the sale in New York of the Guadalupe mines, in southwestern Chihuahua, owned by R. S. Tinnin of San Antonio and G. S. Holmes of Guadalupe, to New York men for \$2,500,000, and that \$500,000 is to be invested in machinery.

#### SOUTH AFRICA.

At Johannesburg one mining company has started crushing ore and four others are preparing to begin.

#### Personal.

JNO. BYRNE is reappointed Montana State Mine Inspector.

C. L. CORY has returned from Virginia, Nev., to San Francisco.

W. H. GAFFET is now Supt. Black Powder Works, Santa Cruz, Cal.

J. ROSS BROWNE has returned to San Francisco from Grass Valley, Cal.

C. L. DIGNOWITY is now general manager Arlington Copper Co., Arlington, N. J.

D. J. SAYER is elected manager Butterfly-Terrill M. Co., Ophir, San Miguel Co., Colo.

JAS. H. ROSS, the new Klondike Commissioner, says he expects to reach Dawson by April 10.

SAMUEL HIGGINS succeeds J. H. McConnell as Supt. of motive power of the Union Pacific system.

E. L. ALLEN of Auburn, N. Y., succeeds C. H. Duell as Commissioner of Patents, Washington, D. C.

W. E. TERHUNE, of San Francisco, takes charge of the Nevada Copper Co. smelter, at Lovelock, Nevada.

F. C. SCHRADER AND W. Y. PETERS, U. S. G. S., have gone on a geological reconnaissance of northern Alaska.

S. W. STRATTON has been appointed director of the new standardizing bureau, at Washington, D. C., editorially noted last week.

J. W. FINCH of Victor, Colo., has been appointed State Geologist of Colorado. He has been consulting engineer Gold Coin M. Co.

L. H. STOCKBRIDGE is manager Cook, Fisk, Gregory and Bobtail mines, Black Hawk, Colo. James Carbis is underground foreman.

GEO. H. PROCTOR is in California and is said to be "projecting" a railroad. He and Giles Otis Pearce in California at one time gild with glory the sunrise of the century.

H. D. C. RICHARDS, Supt. Orleans Bar G. M. Co., is in San Francisco to meet W. D. Baldwin, the president of his company, who comes from New York to visit the mine at Orleans, Cal.

EDWIN REYNOLDS, vice-president and general superintendent E. P. Allis Works, Milwaukee, Wis., was presented with a \$1500 desk by the officers and employees of the company on his 70th birthday, on the 23rd inst.

WM. MCKINLEY, President of the United States, will dedicate a fountain presented by the Donohoe estate to the mechanics of San Francisco, in front of the office of the MINING AND SCIENTIFIC PRESS, on May 21, 1901.

BERNARD MACDONALD AND EDMUND KIRBY, general managers Le Roi, War Eagle and Center Star mining companies, Rossland, B. C., have returned from Victoria, where they went on behalf of the Mine Owners' Association of Kootenay in an effort to have the law repealed which imposes a 2% tax on net shipment values of ore from British Columbia mines.

#### Obituary.

GEORGE SANDOW of San Francisco was killed on the 23rd inst. by falling down a shaft at the Yellow Aster mine, Randsburg, Cal. The deceased was a prominent mining and civil engineer, a genial, pleasant man and a general favorite.

#### Recently Declared Mining Dividends.

|                               |          |

#### Commercial Paragraphs.

THE Compressed Air Machinery Co. is enlarging its facilities at 11-13 First St., San Francisco.

THE Lacy Manufacturing Co. of Los Angeles, Cal., has completed a line of 4-inch pipe for the Exposed Treasure M. Co., near Mojave, Cal.

THE Rlx Compressed Air & Drill Co., San Francisco, has moved into the new brick building at the corner of Fremont and Mission streets, San Francisco.

THE California Hydraulic Engineering & Supply Co., San Francisco, whose offices are now in the Mills building, will occupy the new building Nos. 17-19 Fremont street, San Francisco.

BEGINNING with the 1st prox., Mr. George E. Ames will be the Pacific coast representative of the mining machinery firm of Fraser & Chalmers of Chicago and London. Mr. Ames' office will be Room 15, No. 137 Montgomery St., San Francisco.

THE American Smelting & Refining Co. ordered of the Denver Engineering Works of Denver, Colo., eight large water jacket smelting furnaces for a new smelting plant it is building at Salt Lake City, Utah, together with complete equipments for the same.

THE Machinery & Electrical Co. of Los Angeles, Cal., have completed the installation of a compound duplex mine pump for the Central Oil Co.; also a 60 H. P. horizontal tubular boiler. This is designed to deliver 10,000 gallons per hour to the new reservoir of the Central Oil Co. on their lands at Whittier, Cal., at an elevation of 750 feet through 12,000 feet of pipe.

AN order has been placed with the Edward P. Allis Co. of Milwaukee, through their Spokane office, by the Mountain Copper Co., Ltd., of Keswick, Cal., for machinery for a copper converting plant, consisting of three stands of converters, blowing engine, electric crane and all necessary appurtenances. It is expected that the plant will be in operation in about six months. The total shipping weight of the machinery sold is approximately 500,000 pounds.

CHARLES H. UNVERZAGT, formerly president Hooper Pneumatic Milling Co., 517 West Thirtieth street, New York City, engaged in the business of milling and the concentration of ores without the use of water, has sold a 51% interest in the company, with special reservation of a number of machines for his own use, and proposes to shortly remove west. Under date of March 16 he writes: "The reservation of machines will require \$1,000,000 to capitalize same for use in milling plants and a company for which purpose will be formed in the fall." He also states that his successors propose developing the Hooper pneumatic milling system for the dry concentration of ores on a large scale, not only in its sale and introduction, but also in its use in personal mining operations of the syndicate. The Hooper Pneumatic Co. have closed a contract in Mexico for exclusive license to manufacture, sell and use the process in Mexico. The contract is stated to have been undertaken by representatives of iron and steel works at Durango, Mexico. The company has recently shipped nine machines to the Eagle Fluor Spar Co. in Kentucky, who have been using three machines for some time. Shipments have also been made to Colorado, Pennsylvania, Indiana, and an order is reported for a copper company.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BALING PRESS.—No. 670,175. March 19, 1901. Wm. H. Gray, San Leandro, Cal.

This invention is for improvements in hay presses, and it consists essentially of a door fixed to and turnable with a shaft upon one side so as to move through a projecting hopper, into which the material to be pressed is placed in successive charges. Power devices act to swing the door so as to force the charge from the hopper into the press, and when the press is sufficiently filled the door is latched, the follower is moved upward to compress the bale, and at the instant when the compression is complete the latches are disengaged and the parts restored to the position for making another bale.

CAN FILLING MACHINE.—No. 670,182. March 19, 1901. Erik Manula, Astoria, Or.

This invention is designed for filling cans with salmon and the like, and consists essentially of an intermittently revolving can feeder, a cylinder having

therein a series of measures into which the fish is compressed, and means by which these measures are successively emptied into the cans. Combined therewith are telescopic tubular jaws into which the fish is fed and by which it is delivered into the measures, and a revolving knife by which the fish is cut off when the measures are filled.

CAN SOLDERING MACHINE.—No. 670,180. March 19, 1901. Erik Manula, Astoria, Or.

This invention relates to can soldering machines, and consists of an adjustable feed device, acid trough and solder trough in line and in different planes and adjustable with regard to each other. In conjunction with these are two spirals of different length axially in line and parallel to the two troughs, one governing the advance of the cans through the acid bath, and one the advance through the solder bath.

CAN SOLDERING MACHINE FEED DEVICE.—No. 670,181. March 19, 1901. Erik Manula, Astoria, Or.

This invention relates to an improved feed device for spirally feeding cans in a can soldering machine. It consists of a revoluble inclined support or cone upon the feed end of a spiral driver, with guiding devices by which the can is guided and given the inclination which it is to maintain after entering the acid or solder bath.

ACETYLENE GAS GENERATOR.—No. 670,196. March 19, 1901. E. R. Cook, Sacramento, Cal.

This apparatus is especially intended for the production of acetylene gas, its storage under constant pressure, and its particular application for locomotive headlights. It comprises a novel combination of the generator and gas holding chambers, the removable carbide trays, and means for automatically supplying water to each successively as fast as the previous one becomes exhausted.

#### List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,  
PIONEER PATENT SOLICITORS  
FOR PACIFIC COAST.

FOR WEEK ENDING MARCH 19, 1901.

669,979.—CONVEYOR CHAIN—E. T. Bucknam, Tulare, Cal.  
670,196.—GAS GENERATOR—E. R. Cook, Sacramento, Cal.  
670,175.—BALING PRESS—W. H. Gray, San Leandro, Cal.  
670,177.—SHINGLE MACHINE—J. D. Griffith, Point Arena, Cal.  
670,232.—GATE—C. M. Hooper, Pullman, Wash.  
670,390.—CAN MAKING MACHINE—M. Jensen, Astoria, Or.  
670,136.—OIL CAN FAUCET—W. Laudahn, S. F.  
670,180.—CAN SOLDERING MACHINE—E. Manula, Astoria, Or.  
670,181.—CAN SOLDERING MACHINE FEED—E. Manula, Astoria, Or.  
670,182.—CAN FILLING MACHINE—E. Manula, Astoria, Or.  
670,409.—SOLE TRIMMER—E. F. Maxwell, S. F.  
670,185.—MOP HEAD—J. F. McCleary, S. F.  
670,005.—ROTARY ENGINE—F. H. Palmer, Elma, Wash.  
670,032.—WINDOW—E. Parmentier, Vancouver, Wash.  
670,376.—EXTENSION PLUG—P. H. Quinn, Pasadena, Cal.  
670,391.—PRINTING PRESS FEED—R. Robinson, New Whatcom, Wash.  
670,259.—GAS GENERATOR—J. Trullinger, Bakersfield, Cal.  
670,070.—DISK HARROW—Willis & Porteous, Fresno, Cal.  
670,071.—HARROW TOOTH FASTENER—G. T. Willis, Fresno, Cal.  
670,092.—ORE CAR—G. E. Woodbury, S. F.  
34,236.—DESIGN—B. P. Herndon, Florence, Ariz.  
34,241.—DESIGN—A. H. Leach, Los Angeles, Cal.

AT Trenton, N. J., on the 28th inst., the Court of Errors and Appeals, by a vote of 9 to 5, decided to reverse the Chancellor's decision in the American Smelting & Refining Co. case. This decision orders the issuance of an injunction restraining the American Smelting & Refining Co. from taking any further action in the matter of increasing its capital stock or of acquiring by purchase the property of M. Guggenheim's Sons, unless it be made to appear on final hearing that the stock to be issued for the purchase of the Guggenheim plant does not exceed the value of the property to be acquired by the purchase.

#### Latest Market Reports.

SAN FRANCISCO, March 28, 1901.

SILVER.—Per oz., Troy: London, 27½d (standard ounce, 925 fine); New York, bar silver, 59½c (1000 fine); San Francisco, 59½c; Mexican dollars, 49½c San Francisco, 49c New York.

The Indian Secretary in the British House of Commons on the 26th said the Government had no intention of again considering proposals for the free coinage of silver in India. The coinage last year was sixteen crores, nearly as much as the highest free coinage year, 1877-78. G. Balfour, president of the Board of Trade, also said that no steps had been taken to call an international bimetallic conference.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.50; Casting, 1 to 3 casks, \$16.65; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £68 17s 6d per ton.

The Boston News Bureau says: "The copper market is being held up by main strength and the Standard Oil millions, and the metal people are figuring that it can be sustained for perhaps sixty days longer at present prices, but stocks are declared to be accumulating and, unless there is a change in conditions, prices must give way this summer."

LEAD.—New York, \$4.42; Salt Lake City, \$4.00; St. Louis, \$4.22; San Francisco \$5.00, carload lots, 5½c 1000 to 4000 lbs.; pipe 6½, sheet 7½, bar 6c; pig, \$4.70 @5.10. London, £13 3s 9d per ton=2.86½ cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.5 cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9½c; San Francisco, 1000-lb lots, 12c; 300 to 500 lbs., 13@14c; 100-lb lots, 15@18c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$23; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.50; San Francisco, ton lots, 29c; 1000 lbs., 29½c; 500 lbs., 29½c; less, 30c; bar tin, \$3, 35c.

QUICKSILVER.—New York, \$51.00 large lots; London, \$9 2s 6d; San Francisco, local, \$47.00 per flask of 76½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

ASSAY LITHARGE.—San Francisco, 10c per lb, small lots.

BISMUTH.—New York, per lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 lb lots.

PLATINUM.—San Francisco, crude, \$18 per oz.; New York, \$18.20 per Troy oz. ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, per lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50@60c per lb.

PHOSPHORUS.—F. o. b. New York 50@60c per lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1½ 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11½c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32½@33½c per lb.; carloads, 30@31c in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$1.90 per 100 lbs. 58%; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; flour sulphur, 6c; alum, \$1.90@2.00; roil sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; sks, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

## FOR SALE.

### FOR SALE. ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Hannock, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

## MACHINERY BARGAINS.

I have some splendid Air Compressors, Hoisting Engines, Rock Drills, Rock Crushers, Channeling Machines, Steam Pumps, Boilers, Steam Shovels, Locomotives and Relaying Rails, all in splendid condition. Send for printed list and specify your requirements. I can save you money.

**WILLIS SHAW,**  
627 New York Life Bldg., CHICAGO.

## MACHINERY.

**THE S. H. SUPPLY CO.,**

22d and Larimer Streets,  
DENVER, COLORADO.

The Largest Machinery Depot in the West.

We shall be pleased to send you complete specifications of the following. This is only a partial list; send for complete list No. 41.

**BOILERS.**  
2 100 H. P. HEINE WATER TUBE.  
2 100 H. P. TUBULAR.  
2 85 H. P. TUBULAR.  
4 40 H. P. TUBULAR.  
1 35 H. P. TUBULAR.  
20 SMALLER VERTICAL BOILERS.

**ENGINES.**  
2 18x42 FRASER & CHALMERS CORLISS.  
1 18x36 BASS CORLISS.  
14x20 ATLAS AUTOMATIC.  
12x18 SKINNER SLIDE VALVE.  
10x15 HENDEY & MEYER AUTOMATIC.  
9x12 PAYNE AUTOMATIC.  
7x10 MCINTYRE HIGH SPEED.  
25, 20, 15, 10, 8, 6 H. P. SLIDE VALVE ENGINES.

**GASOLINE ENGINES.**  
15, 12, 10, 4 and 3 H. P. GASOLINE ENGINES.

**PUMPS.**  
12x8 1/2 x10 and 6x4x6 WORTHINGTON DUPLEX.  
12x12x12 DAVIDSON SINGLE.  
7x4x10 DAVIDSON, 10x5x12 SMITH-VAILE.  
12x7 1/2 x12 MARSH, 6x3 1/2 KNOWLES.  
50 BOILER FEED PUMPS.  
FRENCH'S SPIRAL PUMP.

**MILLING MACHINERY.**  
20 850-LB. RAPID DROP STAMPS.  
14 AMALGAMATING PANS.  
11 SETTLERS.  
3 CLEANUP PANS.  
10 AMALGAM SAFES.  
2 AMALGAM CARS.  
12 QUICK ELEVATORS.  
14 WILFLEY TABLES.  
7 BLAKE AND DODGE CRUSHERS.  
3 SET F. & C. 30x10 ROLLS.  
1 SET CORNISH ROLLS.  
5 PERBOLW PULVERIZERS.  
1 40-TON BANCROFT PULVERIZER.  
1 GRIFFIN MILL.  
15-FOOT HUNTINGTON MILL.  
2 HARTZ JIGS, DOUBLE.

**ROASTING MACHINERY.**  
60 IN. x 27 FT. HOWELL IMPROVED WHITE.  
PIERCE ROASTING FURNACE.  
3 REVOLVING ORC DRYERS, 18-FOOT.  
4 RETORTS AND BULLION FURNACES.

**MISCELLANEOUS.**  
Thousands of feet of RUBBER AND LEATHER BELTING, taken from the mills which we dismantle.  
Hundreds of tons of SHAFTING, that for use is as good as new.  
1500 of all sizes of PULLEYS, both wood and iron.

BOXES, HANGERS, COLLARS, COUPLINGS.  
SECOND-HAND PIPE that has all been carefully rethreaded and guaranteed to be free from holes or splits.  
All sizes of VALVES, and large quantities of BRASS GOODS of all kinds.

Our new catalogue is now issued and contains a large amount of information in regard to slightly used machinery and supplies.

All prices are put in plain figures. No discounts.  
**THE S. H. SUPPLY CO.,**  
The Largest Depot for Slightly Used Mining and Milling Machinery in the World,  
22d and Larimer Streets, DENVER, COLO.

## FOR SALE.

A Bruckner Roaster, 8'6"x26'6", with fire-box complete; also Chlorinating Barrel, 5'x9'.

Machinery now, never having been set up. Will sell at a discount f. o. b. Denver.  
Address Box 949, BOISE, IDAHO.

## FOR SALE.

A Large Group of Silver-Lead Properties in British Columbia.

18 Months' Bond. Easy Payments.  
Five Separate Leads. All Carrying Ore.  
For assays and other particulars, write HOPE, GRAVELLY & CO., 536 Hastings St., Vancouver, British Columbia.

## "I've got a FREE SCHOLARSHIP."

Technical Education  
BY MAIL.

To introduce the high standard of The American School of Correspondence, the Trustees have voted to award a limited number of Free Scholarships in Mechanical, Electrical, or Steam

**Engineering,**

including a complete course in Mechanical Drawing.

An excellent opportunity for private instruction in Mathematics, Mechanical Drawing or the sciences, under the direction of competent instructors.

Application blank on request.

**American School of Correspondence**

(Chartered by the Commonwealth of Massachusetts),  
Boston, Mass., U. S. A.

## Notice of Removal.

On or About MARCH 15th

NEXT, THE

**JUSTINIAN CAIRE  
COMPANY**

WILL REMOVE THEIR STOCK OF

Assayers' Materials, Chemicals  
and Mill Screens

To Their NEW BUILDING at

565-567 MARKET STREET,  
SAN FRANCISCO, CAL.

## IF IT CAN BE MADE

—OF—

## PLATINUM

YOU CAN GET IT FROM

**BAKER & CO.,**

408 N. J. R. R. Ave., Newark, N. J.

New York Office, 120 Liberty St.

If interested, write for our "Data" concerning Platinum. We buy Scrap Platinum.

### SOLAR HOUSE LIGHTS

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs **\$4.00** Per Light

**EACH LIGHT LASTS A  
LIFETIME**

Gives a steady light, brilliant as electricity, and whiter. Excels any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.  
Write us for particulars.

DISTRIBUTORS TO THE TRADE:

**BULLARD & BRECK,**  
131 Post Street, San Francisco, Cal.

### Carefully Tested.

Each and every injector we make is carefully tested before it leaves our factory, and card attached showing its exact range. When you buy a

## U. S. Automatic Injector

you are getting the best injector on the market. Fully guaranteed as per card attached.  
Our "Engineers' Red Book" will be valuable to you. It's free for the asking. Write us.

### AMERICAN INJECTOR CO.,

Detroit, Mich.

## THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1 1/2 to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

## Truax Automatic Ore Cars.

Special Side Dump Car,  
Patented.

**COST  
NO MORE  
THAN  
COMMON  
CARS.**

End or Side Dump Car,  
Patented.

We build these cars in a shop devoted exclusively to their manufacture, using the best quality of Steel and Malleable Iron, thus assuring strength and durability.

## Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines OUR SPECIALTY.

—WE BUILD—

### GOLD DREDGES Complete in Running Order

to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

SEND FOR DREDGING CATALOGUE NO. 17.

—WE ALSO BUILD—

ALL KINDS OF

Mining, Milling, Concentrating,  
Pumping, Air Compressing,  
Hydraulic, Water Wheel,  
and Hoisting Machinery.

Evans Hydraulic Gravel Elevators.

—We publish sixteen catalogues. Write for one in the line you are interested in.—

## TANGENTIAL WATER WHEELS

MANUFACTURED BY

RISDON IRON WORKS,  
SAN FRANCISCO, CALIFORNIA. □

We build Water Wheels for any head and for any power. Complete electrical power generator wheels a specialty. Large wheels up to 50 feet diameter for driving compressors.

SEND FOR CATALOGUE NO. 4.

## "THE DANIEL BEST" 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a total capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,

San Leandro, California.

# CATES IRON WORKS,

650 Elston Ave., = CHICAGO, U. S. A.

It is now twenty years since we designed and began to build the GATES GYRATORY ROCK AND ORE BREAKER, since which time we have built nearly 5000 of these machines and set them at work in every quarter of the globe. The success attained by the introduction of this wonderful invention has been equaled by few triumphs in mechanical arts. We have constantly been improving the construction of the machine, and although in the lapse of time many of the original patents have expired, the Gates Breakers to-day are covered by more patents than ever before. We have continually been increasing the size of these machines until now we offer the public our size 9, weighing 150,000 lbs., having a capacity of **200 TONS PER HOUR** and receiving masses of rock or ore weighing more than half a ton.

There are more than two hundred of these Breakers in the South African gold mines.

The Homestake Mining Co. of South Dakota, one of the largest mining properties on the North American Continent, paying a dividend every month, and having ore enough in sight to keep its 1000 Stamps busy for fifty years, uses

## 15 GATES ORE BREAKERS

and buys Gates justly celebrated Stamp Shoes in lots of 10,000.

We build every class of strictly modern

## MINING MACHINERY.

For instance: The Trail Smelters and the Granby Consolidated Mining & Smelting Co.'s plant were supplied by us, and they are the model smelting plants of British Columbia. We guaranteed a capacity of 500 tons per day in the Granby Co.'s two furnaces, while they average 600 tons per day, and have handled as much as 736 tons of copper ore in twenty-four hours.

Gates Mining Machinery is always a little better than it is guaranteed to be.

We build the following Specialties besides those above mentioned: **Stamp Mills, High Grade Rolls, Dryers, Roasting Furnaces, Hoists, Elevators, Screens, Concentrators of every class**, and, in short, every improved mechanical device for working and reducing the precious ores. We built the first Stamp Mill ever set up in the Rocky Mountains. Our manufacturing history covers a period exceeding sixty years. We publish seventeen booklets fully describing our

**MINING MACHINERY, CEMENT MAKING MACHINERY, ROCK AND ORE CRUSHING PLANTS,** Including Ballast and Macadam Plants.

Showing Drum Attachment for Snaking Logs. The ONLY SUCCESSFUL ENGINE; works where others fail.

**100 POUNDS OF ORE SAMPLED IN 10 MINUTES.**

## Calkins' Umpire Ore Sampler.

An accurate, quick and absolutely impartial machine for sampling ore in quantities of from

one to one hundred pounds. Easily operated and cleaned. No danger of salting subsequent samples. Makes the operation of sampling an easy one; and all competent assayers know that to obtain an assay sample by hand requires more trouble and time than is necessary to reduce the resultant sample to the pulp. Diagonally opposite portions are taken each time; and assay samples are obtained with this machine in less time and with less trouble than by any other method.

## THE IMPROVED BARTLETT CONCENTRATING TABLE.

The only table made that will take the place of jigs and do away with costly and complicated machinery.

Especially designed for separating zinc from lead.

Solid Iron Tops, planed to a true surface.

All parts are interchangeable.

Wearing parts reduced to a minimum.

Capacity from 15 to 45 tons in 24 hours, according to class of ore.

Our illustrated catalogue contains all the latest information on the concentration of ores. Mailed on application.

**THE COLORADO IRON WORKS CO.,**

Established 1860.

DENVER, COLO., U. S. A.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## The Best Roofing==

P. & B. Ready Roofing is the only roofing made to withstand heat, cold, moisture, gases, fumes, smoke, acids and the ravages of time. Tin sweats and rusts out. Shingles warp and curl. Slate grows hard, brittle, and flakes off. Iron expands and contracts with the changes of the temperature and becomes useless. Coal tar runs and clogs the drain pipes in summer and cracks in winter. P. & B. Ready Roofing overcomes all these difficulties; besides it's more portable and more cheaply transported; most easily laid, requiring no skill or special knowledge.

Send for booklet. Address Department A.

### "Union" Gas Engines,

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work in Sizes from 3 to 300 h. p. in actual use.

"UNION" COMBINED HOISTS in Sizes from 2 to 130 h. p. in actual use.

"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.

HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.

"UNION" MARINE ENGINES, 4 to 300 h. p., of Single, Double and Four-Cylinder Types.

FIFTEEN YEARS' EXPERIENCE Building Gas and Oil Engines.

"UNION" ENGINES Are In Use All Over the United States.

"UNION" ENGINES Are Simple, Durable and Economical.

Office, 248 First Street. Works, Corner First and Clementina Streets. SAN FRANCISCO, CAL.

## WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says: "It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says: "Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says: "Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

## The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

SOLE AGENTS.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes: our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

# DEWEY, STRONG & Co.. PATENT SOLICITORS,

330 MARKET STREET, - SAN FRANCISCO, CAL.  
AND 918 F STREET, N. W., WASHINGTON, D. C.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

## ASSESSMENT NOTICES.

**LARKIN MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of March, 1901, an assessment (No. 10) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of April, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
N. F. REMINGTON, Secretary.  
Office—112 Main street, San Francisco, California.

**MARIPOSA COMMERCIAL AND MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23d day of February, 1901, an assessment (No. 21) of Ten (\$10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 4th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
JOSEPH H. MOOSER, Secretary.  
Office—320 Sansome street, room 24, San Francisco, California.

**SOUTH SLIGER-GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Spanish Dry Diggins Mining District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of March, 1901, an assessment (No. 1) of two cents per share was levied upon all the issued or subscribed for capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 402 Front street, Room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
J. L. DANIELS, Secretary.  
Office—402 Front street, Room 8, San Francisco, California.

**AMERICAN OIL AND REFINERY COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of March, 1901, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 323 Parrott building, 825 Market St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
J. C. ANTHONY, Secretary.  
Office—Room 323 Parrott building, 825 to 835 Market St., San Francisco, California.

## Special Meeting.

**OXFORD BETA TUNNEL AND MINING COMPANY.**—There will be a special meeting of the stockholders of the Oxford Beta Tunnel & Mining Company, to be held at the office of the company, No. 135 Geary St., Room 111, San Francisco, at the hour of 4 o'clock P. M. on the 4th day of June, 1901, for the purpose of increasing the capital stock of the company from twenty-nine hundred shares of the value of one hundred dollars each to one hundred thousand shares of the value of two dollars and fifty cents each.

W. H. KNIGHT,  
Secretary.

## DELINQUENT SALE NOTICE.

**ALLIANCE EXPLORATION & MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Ophir, Placer County, California.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 3) levied on the 12th day of February, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Names.           | No. Cert. | No. Shares. | Amt.   |
|------------------|-----------|-------------|--------|
| T. Rielenberg    | 7         | 200         | \$4.00 |
| T. Rielenberg    | 34        | 200         | 4.00   |
| T. Rielenberg    | 44        | 400         | 8.00   |

And in accordance with law, and an order from the Board of Directors, made on the 12th day of February, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at 234 Sutter street, San Francisco, California, on MONDAY, the 8th day of April, 1901, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. GOLDSMITH, Secretary.

Office—236 Sutter street, San Francisco, California.

## Annual Meeting.

The Regular Annual Meeting of the Stockholders of the CHAMPION MINING CO. will be held at the office of the company, 113-114 Crocker Building, San Francisco, California, on TUESDAY, the 9th day of April, 1901, at the hour of 2 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the Meeting.

Transfer Books will close on SATURDAY, March 30, 1901, at 12 o'clock noon.

B. N. SHOE-CRAFT, Secretary.

Office—113-114 Crocker Building, San Francisco, California.

have demonstrated  
as valuable in this  
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

## Half-Tones and Illustrations.

Some business men do not properly understand the making and use of half-tone cuts for advertising purposes. It is possible, frequently, to materially improve photographs sent in for half-tones, by painting and retouching. Figures can be strengthened, backgrounds changed to give contrast, obstructions removed, signs painted in, effects heightened or subdued. Photographs that it is necessary to thus alter should be something larger than the cut to be made from them. Changes made on them are thus less apparent when they are reduced to the required size. Work of this kind is charged extra for the time put on it. It is impossible to get photographs for many subjects that it is desired to illustrate by half-tone

11, and the entire advertisement of the John A. Roeblings Sons Co., on page 8, were made from wood cuts. The small cut in the advertisement of the Hooper Pneumatic Milling Co., on page 11, is also from a wood cut. That illustration was engraved on wood for this office, and an electrotype taken for use. To use the original wood cut would soon dim its clearness and sharpness of outline; but an electrotype from a wood cut can be had at small cost, and gives as good an impression as the original. Photographs and wash drawings are frequently worked in combination. It is the usual method employed in handling groups. The photographs are arranged on a background and decorations, lettering, etc., are put around them on the background, and a half-tone made of the whole. The engraver gets a good deal of

Vignettes are more difficult to print with good effect than square finished half-tones, and should only be ordered where they will have careful attention in printing. The advertisement of the California Electrical Works—the Gardner electric rock drill on page 16—is a good example of vignette work. The picture in the advertisement of the Best Manufacturing Co., San Leandro, Cal., on page 2, is a good example of a fair quality half-tone from a photograph direct. The more work put on a half-tone the better it looks, and the more it costs. Ten dollars' worth of extra work can be put on a \$10 half-tone, but for fine work such expense is necessary. There are many other handsomely illustrated advertisements in this issue equally deserving of notice, and that given to those specified is not invidious mention, they being referred

New Shipbuilding Plant of the Risdon Iron Works, Potrero, San Francisco, Cal.

process. Wash drawings are made to take the place of the photograph. A smooth-finish drawing paper is used, and the design is worked up in sepia to look as much like a photograph as possible. To obliterate all brush marks, the design is made two or three times as large as it is intended to have the finished cut. In the reduction, all the imperfections are lost.

The engraving of the new shipbuilding plant of the Risdon Iron Works of San Francisco on this page is an example. A wash drawing was first made. This cost \$75. It was about three times as large as the half-tone herewith. Considerable money is now spent on engraving for advertisements. The original of the picture of the stamp mill in the advertisement of the Union Iron Works of San Francisco, on page 2, cost \$100. The two pictures in the advertisement of F. W. Braun & Co. of Los Angeles, Cal., are good examples of handsome illustration. Another advertisement that cost considerable for engraving, etc., is that of the Edward P. Allis Co., Milwaukee, Wis., on page 9. Wood cuts are also used. The picture in the advertisement of Fraser & Chalmers, on page

criticism that should go elsewhere. Fine half-tones must be printed on good paper to get good results, and they must have good presswork. Don't get fine half-tones for a book or trade catalogue unless you use good paper and pay for having the printing properly done. If the job is a fine one, use enamel paper or sized and super-calendered stock, and go to a printer who has good workmen, good machinery, and takes a pride in his work. If these facilities are not at hand, get coarse half-tones, line etchings or wood-cut electrotypes instead of half-tones.

Vignetting means the cutting away and softening the edges of a half-tone. Material improvement and beautiful effects are possible from vignetting on many subjects. The work is done by hand with a tool after the cut is otherwise finished. The time required in doing it is an added expense to the otherwise price of a square finished cut. A sharp vignette is where all background is cut away. This is used on portraits and machinery to make the subjects stand out in high relief. Soft vignettes are where portions of the background are left on and the edges softened off.

to as typifying the kind of portraiture under discussion. This article is merely in general answer to inquiries on that subject constantly received.

Half-tones can, in many cases, be materially improved by hand tooling, after the cut is finished in other respects. The cut goes to an expert workman, who goes over it as he would a wood cut and lines up portions of it to make it lighter, or burnishes other portions of it to make it darker. The effect is something like a wood cut. The method is largely used in fine illustration and is largely responsible for the popularity of half-tones for the higher grades of illustration. Hand tooling and vignetting are largely employed, also, in fine catalogue illustrations. It is rarely satisfactory to take an electrotype of a half-tone. The process does not do the original justice; and the delicate lights and shades, the tones and half-tones that make this form of engraving so deservedly popular in magazine and newspaper work cannot be successfully reproduced in the electrotype from the plate, and require excessive care in the printing to be even approximately satisfactory.

EDITORIAL.—Prof. Black's Permanganate Process; Flaming Misstatements in Oil Advertisements; Supplying Mining Machinery; Substitution of Pipe Line for Ditch; Canada Determined to Exclude Alien Labor, 165.

MINING SUMMARY.—171-172-173.

LATEST MARKET REPORTS.—174.

MISCELLANEOUS.—Half-Tones and Illustrations, 164. Concentrates, 166 Prof. Black's Permanganate Process, 167. Splicing Wire Rope; Modern Leaching Processes, 168. An English Workman's Views, 169. Mining and Metallurgical Patents; Geological Exploration in Siberia; Work on the California-Nevada Border by the Geological Survey; Electric Power at the Cochiti G. M. Co., New Mexico; Postage Between the United States and Cuba; Preliminary Geological and Mineral Survey of Cuba; L. E. Aubrey State Mineralogist, 170. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Personal; Recently Declared Mining Dividends; Commercial Paragraphs; Books Received; Trade Treatises, 173-174.

DURING the early part of this year Prof. Black of New Zealand made some practical experiments of his permanganate process in the treatment of gold ores at the Lightner mine, Amador county, Cal., a modification of or a substitute for the chlorination process. A technical account of the operation, written for this paper by Dr. Henry Norman, appears on page 167. Thus far, theoretically, 948 parts permanganate of potash are required to dissolve 1568 parts gold. In experiments with well roasted Mt. Morgan concentrates carrying an undetermined quantity of copper, the consumption of permanganate was .2 pound per ounce of gold dissolved, or 2 pounds per ton of roasted ore treated. The Amador county experiments as related give somewhat different returns. As permanganate is the most expensive ingredient in the treatment, the amount necessary in ore treatment will largely determine the commercial value of the process, it being granted that that chemical is efficient therein.

INASMUCH as it was the articles in this paper that largely started the present furore in oil in California, it feels in a measure some responsibility in the matter and dislikes to see such flaming misstatements as appear in many advertisements in many papers that ought to know better. Eastern publications are especially guilty of lending their columns to such misrepresentation. The truth is good enough, and as a cold matter of business it will pay better in the long run or the short run to stick to the facts. In many of these advertisements the facts are greatly exaggerated. Take, for example, the "Eastern Star," which is doing considerable advertising. It announces itself as "the greatest and most productive oil company in California." It asserts that it has extensive holdings in the Kern River district and also "in southern California." Statement is made that it has 660 acres in Kern River district, and, altogether, 1560 acres, 600 of which are in the "rich Kramer district." The company is capitalized at \$2,000,000. Now, regarding Kern county, the company owns twenty acres proven land on Sec. 29, on which two wells are completed. It owns part of Sec. 3, which is not proved territory. Say its twenty proved acres are worth \$5000 per acre, or \$100,000, would make its stock value, if figured on the base of its proved Kern county territory, five cents per share. As for the "rich Kramer district," there is no oil well there as yet. This is a case of a company with some merit that exaggerates and misstates. As for the bare frauds and wildcats, their name is legion, and bear the same relation to legitimate oil mining that camp followers do to an army.

## Supplying Mining Machinery.

The matter and manner of buying mining machinery is always of consequence. Communications on this subject complain of common grievances: one, that the consulting engineer had considerable work done by the firm to whom the bid was proffered without any result beyond expense to the manufacturers; another, that the intermediary placing the business, though manifestly paid by his employers—the mining company—subsequently expected a percentage from the manufacturing concern to whom the bid was awarded, although in his request to them for figures it was distinctly stated that he wanted net prices. In each case the work was of considerable amount. It is only where the proposition is of some magnitude, running away up into the many thousands, that those matters are given much attention, and in no case can anything be said except in the most general way, as those matters are largely left to conditions of a local and individual nature, and can hardly be made the subject of special discussion. There is not much of settled custom or habit, though, ordinarily, in large works, after the responsibly financial firm determine what they want, they usually get expert advice as to how and where their orders shall be placed. This rule prevails more in mechanical engineering than in mining engineering, and more in mining engineering than in civil engineering. In some engineering work the custom is gaining of giving the work of engineering, the design and the contract for construction to the same engineer, and out of this is growing the custom naturally for mining and mechanical engineers to associate themselves with manufacturing or contracting corporations. Then, too, there is a growing tendency of big buyers to place responsibility of design and construction in a concentrated way by putting big jobs into the hands of contractors, who first design and then construct to their own designs and specifications. Of course, in all this the individual is prominent—that is, the individuality of the man. The possibilities of competition do not always embrace guarantee of accuracy and quality, which must necessarily result in its highest degree from a concentrated and interested responsibility.

In this, as in many other cases, whatever secures the best all-round results is good business. Whether it is right for an engineer to reject the lowest and best bids; whether it is proper for an engineer, who is being paid by his employers to get good material at lowest prices, to ask a bonus or percentage from those with whom he places the order, is largely a matter of individual ethics or morality or conscience. Certain it is that it is becoming customary now for engineers not only to specify what shall be bought, but to make purchases themselves, the engineer occupying toward the company the relation of purchasing agent, to get his commission from the concern that he was working for, and not to be supposed to take any commission from anyone else who had dealings with him. If he were in position to make the best trade, to know the merits of each article to be purchased, he could make himself of value. Of course, the contractor who would also be the engineer, if working on percentage on purchases, might have undue temptation to overdo the whole thing. The business relations existing between a big purchasing concern and such a purchaser for them would naturally be on the high plane of personal confidence. The man or men who want to buy a big mining plant, who want the best and get it for the least money, will go about it in different ways, and the men who pay the money usually have their own way about it. No mining machinery manufacturer wants to bid too high or too low on a good contract, nor does he care to give a whole lot of detail, planning, designing, and supplying what may be styled office and architectural work at considerable expense, unless he knows his men. In this regard it is common for a mining machinery concern to tell whoever is asking for plans or designs or special work regarding a proposed plant that they will take the matter up and furnish what is required in the way of preliminary designs, etc., with the explicit understanding that, if they get the work, it is not to be counted, but, if they do not, they will make a reasonable charge for their services in the direction asked. The biggest buying concerns now handle all these things in their own way. For instance, Calumet & Hecla people have one man, Mr. Leavitt, who does all their engineering, designs every detail of

pump, or stamp or motor, and has everything to the smallest piece built to order. Other companies contract for the work done with a man or men who agree to do it for cost plus a certain percentage of profit, though this latter is manifestly open to the temptation of increasing the cost of labor to proportionately increase the profit of the 10% or 15% thereon, as in the case of one contractor of that kind who had an unnecessary building erected and then taken down and rebuilt just for the sake of the 15% he got on the cost thereof. In ordinary purchases such matters as are here briefly referred to do not enter, and where there are big contracts there is no settled manner of procedure, though it is manifest that the consulting engineer is getting more closely in touch with manufacturing establishments everywhere through the growing realization of the necessity of the common interests that the best results may be obtained at the least cost commensurate with quality. In general it were well to eliminate so far as possible the middleman; when principals get together things move much easier. There are always different ways of doing things and different people who believe that some ways are better than others. The best ways succeed; the others fail. In this, as in all other kindred things, experiment and experience and brains are gradually working out the best solution of the problem.

In ordinary transactions where mining apparatus of any kind is wanted the prospective buyer can safely and economically consult any reputable manufacturing firm who have in their constant employ some competent man fully conversant with needs and requirements, and who can intelligently commend or suggest what to get. If he be told just what is needed, what the particular surroundings are, what it is expected the machinery must do, he can give advice that will be worth considerable to the buyer.

Honesty underlies all transactions, and it becomes, after all, a question of the integrity of the individual man. But there are two kinds of honesty. A man may be of the strictest integrity, unapproachable and unbribeable, but there is another kind of honesty which neither deceives itself nor anybody else, and which takes no risk on account of others because of its own possible ignorance. It is also to be noted that some men have talents more in the way of being advisory; they can better tell people how to do things than they could do those things themselves, and very often their advice is good and productive of money saving and money making. Others are destitute of this quality, but can do things and do them well. It is also to be borne in mind that nearly all of us have some one specialty and that no man is all-round complete. It takes several working together to do a thing right; one can take the whole thing and do part of it well, and the rest not so well. Because of this result organizations of men to do so many things which one man can not do, but which must be done and which need to be done together, in the meantime it being necessary to have some one man who has the final say and with whom rests the financial and moral responsibility of the whole thing. The man who can do things is usually the man to whom is given things to do; the man who has demonstrated his ability to make money and save time for others will usually have his way, and the manufacturing concern that has demonstrated ability to make good machinery is rarely at a loss for appreciative customers who are willing to pay good money for good work.

This is necessarily fragmentary and without absolute or clear-cut conclusion, and is largely of random thought suggested by the widening horizon and the many conditions in the complex problem.

THE California Supreme Court in a Tuolumne Co. case has decided that the owner of a ditch right of way across another's land cannot substitute a pipe line for the ditch without the consent of the land owner. The decision is of importance, for as water becomes more valuable there is a natural tendency to avoid wasteful losses from ditches by substituting pipes, particularly where opportunities offer for the development of power.

CANADA is determined to exclude alien labor; the Dominion parliament has passed a bill making it impossible for any Canadian employer in mine or mill or other work to engage the services of any one not a British subject. It is an arbitrary measure, a backward step, an unwise effort, and will not prevail.

## Concentrates.

PRESENT United States monthly shipments of silver are about 3,000,000 ounces.

At 32° F., 1 cubic foot of water weighs 62.42 pounds; at 100° F., 62.02 pounds; at 212° F., 59.76 pounds.

CHEMICALLY PURE MAGNETITE contains 72.4% iron; magnetite ore carrying over 50% iron is high grade.

TO CUT a bottle fill it with oil up to the line at which it is to be cut, make an iron rod white hot, and dip it into the oil.

EXPORTS of refined petroleum from the United States represented in 1898 a value of \$51,242,933; in 1900, \$67,740,106.

A SAND SLUICE should have a grade of  $3\frac{1}{4}$  inches to every 16½ feet; a blanket sluice should have a grade of about 3 inches in 7 feet.

THE United States Geological Survey reports the 1900 production of spelter in this country to have been 122,116 short tons; in 1899, 119,407.

"ABSOLUTE ZERO" is considered to be -273° C.; liquid hydrogen boils and volatilizes at -240° C. under ordinary atmospheric pressure.

THE daily capacity of the smelter at Northport, Wash., is about 1300 tons; of the Trail, B. C., smelter, 800 tons; and of the Hall Mines, 300 tons.

TELLURIUM is soluble in sulphuric acid, giving a red solution, from which a blackish-gray powder of tellurium is precipitated by diluting in water.

STEAM at atmospheric pressure flows into a vacuum at the rate of 1550 feet per second, and flows into the atmosphere at the rate of 650 feet per second.

ORDINARILY, with a diamond drill, hand power, 1½-inch bit, 15 feet per day may be drilled in medium rock, which would make the minimum cost about \$1 per foot.

A "CORD" of ore, as the term is used in Colorado, is a quantity in weight varying from six to eight short tons. It is ordinarily used to measure ore that is treated in a stamp mill.

ONE-SIXTEENTH of an inch of scale on the inside of a boiler will reduce the conductivity of the sheets about 15%; one-sixteenth of an inch of soot on heating surfaces reduces conductivity 15%.

CHILE now produces about 21,000 tons of copper annually. Most of the ore is exported; the Chilean copper works are not very active at present. Want of means of transport is one cause of such depression.

GARNET is found in abundance in Alaska and more sparingly in North Carolina and Pennsylvania. As an abrasive, corundum and emery lessen the demand, though as a gem fine specimens are of value.

SATURATED STEAM at a pressure above zero of 150 pounds per square inch has a temperature of 361.76° F., latent heat 857.98 B. T. U.; a total heat above zero of 1224.28 F., B. T. U., and 1 cubic foot weighs .3466 pound.

CLAYS, and, in general, alumina compounds do not tend to form scale in steam boilers; carbonates, and sulphates of lime and magnesium do. Free sulphuric acid does not form scale, but corrodes the boiler plates and tubes.

BLUE-PRINT PAPER with usual coating requires an exposure of from four to eight minutes in bright sunlight. A quick-printing blue-print paper is furnished, in which the exposure is completed in from one and one-half to two minutes.

IN an inclination of 100 feet in 100 feet corresponding to an angle of 45°, a load of 2000 pounds will produce a strain on the rope of 1419 pounds; and for a load of 9000 pounds the strain on the rope would be  $1419 \times 9000 \div 200 = 12,771$  pounds.

THE idea of the Shasta, Cal., miner that medicine chests made up with special regard to miners' needs be prepared for sale in different mining camps, particularly isolated ones, is good, but not new, and might in some cases be of practical value.

AN electric meter should be in a position insuring the minimum of vibration. An extremely hot or damp location should be avoided and places subject to steam or chemical fumes, such conditions tending to reduce its durability and satisfactory operation.

BLACK FLUX is prepared by gradually introducing in small quantities into a crucible heated to a dull redness about 1150° F.) a mixture of two parts cream of tartar and one of niter. Some prefer to have the mixture made of equal parts cream of tartar and niter.

IN California 3.6 barrels fuel oil is considered equivalent in heat power to one ton anthracite coal. San Francisco can consume 250,000 barrels per month. The present price of oil at Bakersfield, Cal., is 25 cents per barrel; at Los Angeles, 75 cents; at San Francisco, \$1.

CUSTER CO., MONTANA, has 20,490 square miles, San Bernardino Co., California, 19,947; Lincoln, Nevada, 19,437; Coconino, Arizona, 19,322; Nye, Nevada, 17,376; Choteau, Montana, 16,049; Socorro, New Mexico, 15,386. The largest county in Texas is El Paso, 9,353 square miles.

ACCORDING to the law of flow of gases through an orifice, the flow increases as the square root of the increase of pressure. Hence, a blower having no grease or packing on the working surfaces, and working under a pressure of fifteen pounds per square inch, would leak

3.872 times as much as it would when working under one pound pressure, provided the machine is constructed so rigidly that there is no more spring of the parts at fifteen pounds than at one pound.

A SINGLE leather or three-ply rubber belt traveling 100 feet per minute, at ordinary tension, will transmit power proportionate to its width. It is calculated that a belt 3 inches wide will so transmit .34 H. P.; a 5-inch belt, .66 H. P.; an 8-inch, 1.06 H. P.; a 12-inch, 1.6 H. P.; an 18-inch, 2.4 H. P.

THE postoffice department at Washington has changed some of the names in the State of Washington—"Spokan" in place of Spokane; "Lake Kootenai" for Lake Kootenay; "Pond Oreille" for Pond d'Oreille; "Clealum" for Cle-Elum; "Sanpoll" for Sans Poil, and "Okinagan" for Okanogan.

THE west coast of South America has been pretty well exploited by Spanish, American and German miners. On the eastern slopes of the Andes on the confines of the Argentine Republic is a newer mining field, and one that may be opened up by American miners, as it is now connected with Buenos Ayres by rail.

THE Oregon Legislature has amended the mining law of that State by requiring prospectors to stake claims within thirty days after posting discovery notices. They are also required to sink a 10-foot shaft or dig a 10-foot tunnel within sixty days after posting notices. The fee for recording with the county auditor remains at \$1.

NITRO-GLYCERINE is made by spraying ordinary glycerine into a vessel of mixed nitric acid and sulphuric acid in the proportion of two parts sulphuric acid to one part nitric. The glycerine instantly combines with the acids and floats to the top, whence it is skimmed and washed until all the free acid is taken from it, when it is a merchantable commodity.

REGARDING the commended use of ground glass as a flux for cyaniding slimes, as noted in last Saturday's issue, borax-glass and silica are also used for fluxing gold slimes with satisfactory result, in the following proportions: dried gold slimes 10 parts, borax-glass 4 parts, silica 2½ parts, forming a liquid slag, from which the gold settles readily.

A DOUBLE REEL HOIST, first motion, with capacity 1500 feet rope, would have approximate dimensions: Reels 48 inches center diameter; 10 feet diameter of arms; 5 inches wide; rope  $\frac{3}{4} \times 4\frac{1}{2}$  inches; engine 80 pounds boiler pressure, 20x48 stroke; 75 revolutions per minute; load 8000 pounds, exclusive of rope. The shipping weight of above would be about 108,000 pounds.

MINERALS of low magnetic permeability can be cheaply made more magnetic by gentle heating in a non-oxidizing atmosphere. In the Wetherill magnetic separator the separation is largely made possible by the use of powerful electro-magnets so arranged as to produce a magnetic field of great intensity. By its use spathic ore is susceptible of separation from zinc blende and brown hematite from calamine.

THE circumference of a circle multiplied by 0.282 equals the side of a square of the same area; the contents of a round tank can thus be compared to that of a square tank. A round tank 4½ feet diameter holds 103.03 U. S. gallons for each foot in depth; one 11 feet diameter holds 710.6977 gallons for each foot in depth. A gallon of distilled water at 39° F. weighs 10 pounds; a gallon of pure alcohol, 7.9 pounds; benzine, 8.5.

THE late Montana Legislature has changed the laws relating to mining locations in that State. By the law as it now stands, work must be done within sixty days (old law ninety days) after location. The locator, if he makes a defective location or desires to alter the boundaries of his claim, is now permitted to file an amended declaratory statement, provided it does not conflict with intervening rights of other locators.

IN air compressor practice the air pressure required has been constantly increasing; in many up-to-date compressed air applications, 100 pounds steady working air pressure under full speed is considered essential to the attainment of satisfactory results. The adaptability of application is so extensive that it is ultimately economical in many cases to provide a compressor of 50% greater capacity than immediate necessity or original intent may seem to demand.

PRISMATIC COMPASSES permit of observing the magnetic azimuth of objects not in the plane of the observer, and are more accurate than others (except the regular surveyors' compasses), because by means of the prism the vertical hair of the sight-vane appears directly continuous with one of the divisions. The object, by means of the vertical hair, is vertically projected to the plane of observation, so that angles are observed in one plane, like they are laid down on a map. Their accuracy can be increased by repeating the observations, and taking their mean, or by back-sighting.

IN no Arizona copper refining works are remelting furnaces now used. At the Copper Queen the matte, made from a mixture of oxidized and sulphuretted ores in cupolas of 120x42 inches at the tuyeres, is discharged into large wells mounted on rollers, and rotated like the converters by hydraulic machinery, one well in front of each furnace. From these wells the slag flows continuously; the matte is poured directly into the converter, on a lower level. The tilting well was adopted because of the difficulty of controlling the flow through a tap-hole directly into the converter from a deep receptacle holding so many tons of matte. To remedy the defects

of the plan each furnace is provided with two wells in tandem. An electric crane moves the matte from any furnace well to any converter, and lifts the converter slags and pours them into one of the wells nearest a furnace stack. In the new works at Nacosari, Sonora, Mexico, the well is placed to the side of the furnace instead of in front; it can be tilted to the rear as well as to the front, and so when it has to be emptied of matte the supernatant slag can be poured off to the rear.

THE American Smelting & Refining Co. are credited with an intention to reduce treatment charges at their Colorado works. They are stated to be remodeling plants and installing automatic machinery, cutting down losses and reducing the amount of labor. If these improvements, cheapening costs, result in materially reducing the treatment charges, the mining of many of the low-grade ores of Leadville and other districts will be possible, and a largely increased metal output will result. It is expected that ore yielding only \$10 a ton will, with the reduced charges, pay a profit.

THERE is nothing in "law" as "law" to aid or deter a miner, and the miner who takes newspaper law as a guide will never do much. True he may "make no mistakes," but he will not be likely to make anything else, and the man who never made a mistake, besides being lonesome, never amounts to much. After all, the "law" is only a collection of memoranda, and a miner needn't worry much over not knowing what was the latest idea in the mind of some judge who thus gave a court a majority decision upsetting some former ruling. Less than half of those who make a business of knowing all about law succeed, for one-half the lawyers in every trial get beaten.

A CONDENSING engine would require about twenty-five times the amount of feed water for condensing purposes: from 1 to 1½ gallons condensing water per minute per indicated horse power. A surface condenser for a compound steam engine would require about 2 square feet of cooling surface per horse power; an ordinary engine would need more surface according to its economy in the use of steam. To insure satisfactory result the air pump must be set lower than the condenser. With a good air pump and condenser there should be secured 25 inches of vacuum, which would render available about ten pounds more mean effective pressure with the same terminal pressure.

WHERE the crucible method does not wholly give satisfaction in assaying scorification should insure accurate results. In a circular, shallow, fireclay dish 2 inches in diameter is put one-tenth of an assay ton of pulp, mixed with twenty grammes chemically pure test lead, a similar amount of the latter added and a small quantity of coarse-grained borax, the charge placed in the muffle and the door closed until the operation is well under way, when it will be noticed that the melted metals lie in the center of the scorifier, a glowing mass, surrounded by a ring of melted slag. After this latter has completely closed over the metals the assay is poured into a mould, the slag removed and the lead button cupelled.

AFTER sylvanite, or graphic tellurium—the most widely distributed of the gold-bearing telluride minerals—calaverite and petzite are the most likely to be found by the prospector. The first of the two is the most valuable of the tellurides, containing the highest percentage of gold. It occurs massive, without any indications of crystallization; color, bronze yellow; streak, yellowish gray; brittle; fracture, uneven. There are several varieties of petzite, which resemble each other closely in physical character, but differ a little in chemical composition. The common variety occurs massive to granular; color, steel gray to iron black, tarnishing. In calaverite the ratio of the gold to the silver is 6 to 1 or 7 to 1; in petzite the ratio is 3 to 1; in sylvanite, 1 gold to 1 silver.

THE present terms of "coke" and "charcoal" as applied to tinplate are misnomers. They refer now only to the thickness of the tin coating, a "coke" plate having on it the lightest coating of tin, while "charcoal" plate has a heavier coating. Both are made from identically the same black plate. The use of these terms originated in the fact that when charcoal iron and coke iron were both used in tinplate making, the charcoal iron, being of better quality, had a heavier coating put on it, while the coke iron was used only for the cheap grades, which were given the lightest coating. When steel came to be universally used, the terms remained, referring then only to the quantity of the coating.

THERE is no good foundation for prejudice against "pocket" mines. Nearly all mines are more or less pockety or spotted. A real pocket mine is one where an exceedingly rich bunch of ore occurs occasionally, while the rest of the vein is comparatively barren. Sometimes it takes all the money found in one pocket to carry on the work to reach the next. Occasionally six months or a year's work is spent before a good pocket is found. Some of the pocket mines have been worked for a number of years in a sort of intermittent way, but have been found to pay in the end. The ledges of these mines are usually small. But even in the chimneys of good, well-defined wide ledges there are poor and rich spots—not so marked, of course, as in the true pocket mine, but occurring nevertheless. Possibly the pockety mines will not hold out as long or warrant expensive plants, but then much less ore is mined. Sometimes a vein is pockety and extremely rich on the surface, which, with depth attained, settles down into a steadily paying proposition.

## Prof. Black's Permanganate Process.

Written for the MINING AND SCIENTIFIC PRESS by  
DR. H. NORMAN.

The process under consideration is claimed to be an improvement upon chlorination methods, and was patented by Prof. Black about two years ago, its principal features being reviewed shortly afterwards in the columns of the MINING AND SCIENTIFIC PRESS. Since then no additional information has come to hand, except occasional brief announcements stating that practical demonstrations of the method were being made in New Zealand and the Australian colonies. These demonstrations to popularize his process, however, partook of the character of mere spasmodic endeavors on the part of the discoverer. His duties left him no time to conduct in person more than one or two experiments at the mines visited by him. Succeeding trials had to be entrusted to local operators.

Prof. Black recently made a brief visit to this country, but circumstances compelled his return to New Zealand on a date which precluded work in more than the counties Nevada and Calaveras, Cal. Even this restricted area had finally to be reduced, and the Professor's activity concentrated upon Nevada City and Angels Camp.

The managements of the two companies approached at the latter place granted every facility for the proper exposition of the Professor's discovery, and furnished the bulk of the chemicals used. It is to be regretted that no analyses of the sulphurets under treatment were on hand, and that apparatus to locally determine the percentage of calcium, magnesium and other constituents causing an undue consumption of chemicals, was also lacking. Estimating these points at their exact value, it is not too much to say that the new method justified its claim to preeminence over chlorination. The superintendent of one of the works admitted a saving in the cost of chemicals; the other conceded a slightly higher extraction of gold.

The writer was asked by Prof. Black to undertake a description of the salient phases of his discovery for the MINING AND SCIENTIFIC PRESS, and the present monograph is the outcome of this friendly request.

The chemistry of the permanganate process is simple, as appears from the following equations:

And:—

The precipitation of the gold from solution then occurs in the well known manner:

The process is intended as a substitute in all cases where by present methods chlorination is indicated. The most common material suitable for the new treatment would, therefore, be sulphide of iron—the pyrites or sulphurets, which contain variable but usually small amounts of arsenic, copper, zinc and lead sulphides, and more or less gangue. Such mixtures may be either the pulverized raw ore or the concentrates produced directly for leaching, or by-products from preliminary gold extraction methods, generally amalgamation. Telluric ores, it will be seen below, have been treated with much success, but when arsenic enters largely into the composition of the ore variations of the process are necessary. Coppery and leady ores, in which such metals exist to large extent, are not adapted to it, but are better relegated to other treatment, such as smelting. Zinciferous ores are, as a rule, not notably gold-bearing, and their treatment is ever complicated, with loss of gold. Assuming, then, an ordinary case of sulphurets, with no excessive amounts of foreign sulphides, the finely pulverized material is first subjected to a thorough roast—exactly as though preparing it for chlorination. The roasting eliminates the main part of the sulphur in the form of sulphur dioxide, drives off the arsenic as sulphide or as arsenious oxide, and converts the metals into oxides and sulphates. The early stage of the operation is carried on at as low a temperature as possible, otherwise the sulphides may fuse, under which circumstances further oxidation is difficult and incomplete. Towards the end any necessary degree of heat may be employed, as the fusible sulphides have been destroyed and the infusible oxides and sulphates substituted for them during the progressively increasing heat, and under unrestricted access of oxygen. The sulphates are here mostly decomposed into oxides and volatile sulphuric anhydride, the roast being "dead" or complete when the last traces of the latter are expelled. A bright piece of iron immersed in a vessel of water into which a sample of the hot roast has been thrown should remain bright; if tarnished, further heating and rabbling are necessary. This is also an opportune moment to ascertain the condition of the iron. To this end draw a clean, dry magnet through a sample of the roast. Should any particles adhere, arranged in the characteristic bristly manner, ferrous or magnetic oxide ( $Fe_3O_4$ ) is

still present, and the roast faulty. The remedy is an abundant admission of oxygen (atmospheric air) at a dull red heat for a short period, viz.:

A white heat must be avoided, because under its influence oxygen is driven off, thus:

Ferrous oxide would, on the addition of the usual preliminary wash, or of the leaching fluid, which both contain sulphuric acid, be converted into ferrous sulphate, which in its turn would throw down the gold before the elevation of the latter from the pulp. This premature precipitation would mean the loss of most of the precious metal. The first reaction is illustrated by the following:

Whereas, if all the iron had been ferric, no such complication would have arisen, as is evidenced by this equation:

The admixture of salt to the roast is to be deprecated. In chlorination it is said to be beneficial in instances where the ores are accompanied by a talcose gangue (as at Angels Camp and other places in California), acting by aiding in removing the talcy or grease-like coating of the gold through probable conversion of the magnesia into chloride. In such cases extreme care is required in the management of the heat, for there is an inevitable loss of gold through volatilization of gold chloride, which may more than offset the advantages otherwise. Careful attention to the ordinary oxidizing roast is safer, and the alleged breaking up of talcose gangues by the hydrochloric acid evolved cannot be as great as that possible by the chemically much more active sulphuric acid used in permanganation. Dr. Black permits the use of salt, but it occurs to the writer that any auric chloride formed during the roasting will be dissolved out by the preliminary wash and thus run to waste. The danger of loss from this cause is palpably greater than from mere volatilization of  $AuCl_3$  in the furnace.

When the roast is finished it is allowed to cool and is then shaken over screens into a leaching vat of precisely the same construction as those employed in chlorination—that is to say, in so far as the filter bed is concerned. A lid is unnecessary, the vat remaining open during the entire process of leaching. Previous to this, and while perfectly dry, the vat and solution tank must be painted on the inside with hot melted paraffine. It penetrates deep into the fiber of the wood, and one application suffices, maybe, for the whole existence of the vats. Permanganate of potash, in contact with organic matter, rapidly yields its oxygen and is decomposed. It is to avoid this that the paraffine wax is used. While coating the vats, a "float"—a short piece of light pine board, say, 1x12x30 inches—may also be painted on all sides with the hot paraffine. This float is placed upon the pulp in the vat, directly under the jet of the solvent from the solution tank above, and serves to distribute the fluid falling upon it over the entire superficies of the roasted charge. Without such a splashboard, the powerful stream would quickly burrow through the pulp and escape through the outflow at the bottom, instead of percolating slowly and evenly, and dissolving out all the gold.

A preliminary wash of the charge in the leaching vat is nearly always advisable. According to the constituents of the pulp, this wash will consist either of water alone, or of water strongly acidified with  $H_2SO_4$ ; or of this dilute mixture with a wash of pure water to follow. Lime is converted by the acid into the insoluble sulphate, and in that state does not further interfere with the process. Magnesia, on the other hand, is made soluble and carried off during the washing. Copper, if present, becomes  $CuSO_4$ , copper sulphate ( $CuO + H_2SO_4 = CuSO_4 + H_2O$ ), which has a marked mechanical affinity for  $FeSO_4$ . Both may be removed by aqueous lavation and the liquor run onto scrap iron, to recover the copper as cement. To determine whether all the  $FeSO_4$  is washed out, it is only necessary to acidulate a sample of the washings with  $H_2SO_4$ , and add, drop by drop, some solution of  $K_2Mn_2O_8$ . The presence of  $FeSO_4$  is indicated by decoloration of the permanganate, which will give up oxygen until all the  $FeSO_4$  is converted into  $Fe_2(SO_4)_3$ . When the pink tint begins to stay, the washing may be discontinued. The reaction is shown in the following equation:

In a solution tank at a suitable elevation above the vat a solvent is now prepared composed of approximately 10–12 pounds of common salt, 10–12 pounds of strong sulphuric acid and 10 ounces of commercial permanganate of potash, for every 100 English imperial gallons of water, the imperial gallon being equal to 277½ cubic inches. The salt and permanganate are dissolved first in, say, 70–80 gallons of water; the acid is now poured slowly into a large pail of water, the diluted mixture added to the salt and potash solution, and the whole made up with

water to 100 gallons. On no account must the  $H_2SO_4$  be added without prior dilution, for obvious reasons.

Of course, an aliquot quantity of the solvent may be prepared at one time. However, each ton of pulp requiring on an average 125–150 gallons of solvent, it is convenient that the solution tank should be of a capacity proportionate to that of the leaching vat. If, for example, the latter be intended to hold 40 tons of pulp, the tank should hold  $40 \times 150 = 6000$  gallons of solution.

After the preliminary wash the faucet of the solution tank is turned on full, and the liquor run onto the float, until the pulp is covered to a depth of 4 to 6 inches, when the stream is lessened, to correspond to that which will shortly emerge from a partly opened spigot terminating the discharge pipe at the bottom of the leaching vat. The luvium, or filtrate, carrying the gold in solution, collects in a tank on a somewhat lower plane, and the flow from the spigot is so regulated that the pulp is exhausted before the whole of the solvent has passed through. Generally from ten to twenty hours are needed for this, according to the amount and physical character of the gold. The solution takes place by simple metathetical reaction, and the metal can be detected in almost the very first portions of the filtrate. The latter gains in richness up to a certain point, after which it will gradually commence to go down again. This stage is easily determined by half filling a beaker glass with solution from the spigot, acidifying with  $H_2SO_4$ , and adding excess of solution of ferrous sulphate. If, on holding the beaker to the eye against the light, the contents are beginning to show signs of translucency, all the gold has gone into solution. The spigot is immediately turned on full, and an ample water wash completes the leach. The solvent passing through after opening the spigot contains but little gold, and may, therefore, be collected separately, together with the final washings. They are returned to the solution tank, to be used for the next charge. This and a multitude of other economies may be made, suggested mainly by the individual knowledge, experience and ingenuity of the operator.

The concluding phase of the process is the precipitation, which in no wise differs from that practised in chlorination. The filtrate is rendered distinctly acid with  $H_2SO_4$ , and a strong solution of ferrous sulphate added to it, which should be freshly prepared, to have it free from the basic per-salts so rapidly formed. Scrap iron is dissolved in sulphuric acid, an excess of iron being always kept present, to counteract oxidation into the ferric compounds, which, of course, possess no precipitating power for gold. The metallic gold thrown down is allowed to settle thoroughly, and the supernatant liquor is drawn off onto a canvas-covered filter of sand, in order to catch any minute particles of gold that may have remained in suspension.

Theoretically, about 6 cents' worth of chemicals will dissolve 1 ounce of gold. In practice the figures are higher, but should never exceed 25 cents, or thereabouts. At the world's greatest gold producer, the famous Mt. Morgan mine, near Rockhampton, in Queensland, Australia, ore having an assay value of 11 ozs. 15 dwt. per ton of 2240 lbs. was treated by Prof. Black at a cost of 4 shillings 6 pence per ton, or about 9 cents per ounce of gold. The extraction was good—95.1%—but not what may be justly expected in time. The professor's experiments there and elsewhere have so far been purely tentative. He desired solely to give publicity to his methods and have them tried by practical men, believing, with the MINING AND SCIENTIFIC PRESS, that "the greatest requisite element of commercial success is wide publicity." A highly satisfactory extraction is also announced from the Bethanga mine, Victoria, a large concern, employing 260 men. The rock, which is crushed by rollers, carries an unusual percentage of arsenic, and does not yield kindly to the ordinary leaching processes. Experiments are proceeding, too, in Western Australia, more especially, in the Kalgoorlie district. Telluride ores from the Great Boulder, the Lake View Consols, and the Ivanhoe mines, assaying as high as 107 ozs. of gold to the ton, have been treated with complete success under the greatest imaginable disadvantages, inasmuch as no elaborately detailed directions—such as are presented here, for instance—were furnished the operators. A batch of ore from the Thames district, New Zealand, sent for treatment to the laboratories of the Dunedin University, was subjected by the teachers and senior students to permanganation. The college records show an extraction of practically 100%, no calculable loss being observable with the sensitive assay apparatus of the University. This cannot but have been an ideal ore, treated under ideal conditions.

Among the principal substances which may be present to bring about an excessive consumption of chemicals and loss of gold are, as already stated, undecomposed sulphides, ferrous sulphate, arsenic, antimony, lead, copper, lime and magnesia. Organic matter must also be guarded against. Wood chips, portions of ore sacks and other products of the vegetable kingdom dropping into the vats will quickly decompose appreciable amounts of  $K_2Mn_2O_8$ , and so will any dabbling in the solvent with the hands and arms.

The chief points of advantage of the permanganate over the chlorination process are a tremendous sav-

ing in first cost and subsequent maintenance of plant; an extraction rarely as low as, and generally several per cent higher than, in the older method; a reduction of working expenses, and an utter absence of mephitic and corrosive fumes. The cost of gas generators is saved, as is that of ponderous lids for the vats, and of the tackle and carriages on which to move them. The vats, after having been thoroughly impregnated with paraffine, last twenty years or more, instead of two or three years, as hitherto. A mouthful of the menstruum swallowed will show that it is absolutely non-corrodent in the ordinary sense of the word. One large vat at less than half the cost will answer, where so far a number of small ones have been in use. Considerably less floor space is thus required, and a proportionately smaller building, necessitating much less grading, excavating, etc. The cost of chemicals is pronouncedly less, and so is the time occupied by the process. One man can easily attend to all the leaching, no matter how large the plant; and the employment of the pernicious chlorine gas, so destructive to lung tissue and membrane, is wholly done away with. Imperfectibility in details is not denied, but is, on the contrary, freely recognized and closely studied. The cleanness, cheapness and extraordinary simpleness of the method should secure it a reasonably fair trial by all interested. This opinion applies especially in cases where new works are planned. Laboratory experiments will give a good indication of what may be expected on a large scale.

### Splicing Wire Rope.

The following directions for splicing wire rope may be found useful, but, as a rule, it is desirable to employ an expert to do this, since it requires considerable skill to splice a wire rope well, and to one unfamiliar with the method of procedure printed directions are of little value. The matter is taken from "Wire Rope, and Its Application to the Transmission of Power," published by the Trenton Iron Co., Trenton, New Jersey:

First.—Clamps are applied to the rope sufficiently far back from the ends to allow plenty of room for the splice, and the men to operate in. The two ends are then drawn together by means of blocks and tackle, until they overlap each other for a space of 20 to 30 feet, according to the size of the rope. At a point from each end midway of the lap, the rope must be bound with a good serving of No. 20 or No. 18 annealed wire. The serving at the extreme ends is then cut off, the strands uncoiled to the new serving and the hemp cores also cut off so as to abut when the open bunches of strands are brought together, and the opposite strands interlaced regularly with each other, presenting the appearance, as near as can be shown, in Fig. 1. The serving x is then cut

FIG. 1.

off, and the strands 2, 3, 4, 5 and 6 bent back out of the way and tied temporarily to the rope.

Second.—Unlay any strand a, and follow this up with the free strand 1 of the other end, laying it tightly into the open groove left upon unwinding a, making the twist of the strand agree exactly with the lay of the open groove, until all but 12 or 18 inches of 1 is laid in, when a is cut off to within the same distance of the rope (see Fig. 2) and (excepting rope

this is where the skill comes in. Before doing this, care should be observed to see that the spliced portion of the rope is perfectly limp, or free of tension, otherwise this operation cannot be well performed. That portion of the rope where the ends are to be tucked in must first be untwisted, for which purpose special lever clamps are provided made of hard wood, two of which are applied, one on each side of the projecting ends. By turning these clamps in opposite directions the strands are separated, presenting the open appearance shown in Figs. 3 and 4, disclosing

FIG. 3.

FIG. 4.

the core. Without such clamps, the ropes may be untwisted by wrapping either side in opposite directions with a short piece of hemp rope laid double, using sticks passed through the end loops to turn with. If a vise is available, it will be more convenient to secure one side by this means, in which case but one clamp or rope sling and stick, as the case may be, will be required. The core is then cut and pulled out on the side corresponding with the end to be tucked in, for a distance equal to the length of the end which is to replace it. A sharp knife is needed for this purpose.

The end to be tucked in is then straightened. It is desirable, especially if the rope is composed of small wires, to tie the ends of the strands with soft twine or threads of jute yarn, in order to keep the wires well bunched. A marlin spike is then passed over a and under two of the strands, as shown in Fig. 3, when the core is cut off at the proper point, and, by moving the spike spirally with the strands, the loose end a is passed into the core space and the spike withdrawn. (Fig. 4 shows the end partially laid in, after having cut off the core.) Then pull out the core on the other side, pass the marlin spike over 1 and under two strands, as before, cut off the core,

FIG. 2.

of Lang-lay) passed under 1, leaving the ends projecting while the other strands are laid in. Some tie these ends for the time being, although this is not essential.

Third.—Cut off the serving y and unlay a strand 6 of the opposite end, following up with the strand f, and laying it into the open groove as before, treating it precisely as in the first instance. Next, pursue the same course with b and 2, stopping, however, at a distance from the first ends of 4 to 5 feet, so as to leave a space of about a foot between the ends when finally tucked in. Next, do the same with e and 5, then c and 3, and finally d and 4, until all of the strands are laid in, with the respective ends projecting, as shown in Fig. 2.

Fourth.—The next thing is to tuck in the ends, and

and tuck in the end 1 in precisely the same manner, after which the rope is twisted back again as tightly as possible, and the clamps or other appliances that may be used are removed to the next pair of projecting ends. Any slight inequality in the symmetrical shape of the rope may be taken out by pounding with a wooden mallet. Some prefer to tuck in first all the ends projecting in one direction, and then the ends projecting the other way; it is immaterial in what order they are tucked in. If these directions are implicitly followed, the spliced portion of the rope will be of uniform diameter with other portions and present a smooth and even appearance throughout. After running a day or two, the locality of the splice cannot be readily detected and the rope will be quite as strong in this portion as any other.

### Modern Leaching Processes.

Written for the MINING AND SCIENTIFIC PRESS by DR. J. OHLY.

The great number of lixiviating processes, applied at the present in the several plants of the West, is conditioned in part by the extraordinary variety of the ores to be treated, so that a low-grade copper ore, free from certain admixtures, gives quite satisfactory results when leached by means of sulphuric acid only, while other copper-bearing minerals are necessarily excluded from this treatment owing to the presence of basic admixtures, which cause a great consumption of the solvent employed, and thereby entail considerable loss.

This observation refers especially to a class of copper ores, which carry, besides a small percentage of metal, larger amounts of iron, alumina, lime or magnesia, which can not be separated to advantage from the real ore, and are changed, on being acted upon by sulphuric acid, into sulphates, the acid employed for the formation of these salts not being recoverable by any process extant. In such cases a method known as the ammonia process is obviously the one to be chosen, since it is a well-established fact that copper oxide will dissolve at common temperatures in ammonia water, the result being a compound known as copper-ammonium, which has a characteristic blue color, and the more intensely so as the degree of concentration increases. On the other hand, this solvent does not enter into combination with the basic compounds mentioned above, nor does it form soluble salts with them, so that it acts practically as an extracting medium for the copper values, if only such are present in the ore. It is claimed for this process, moreover, by the inventor—Captain Collins—whose address we had occasion to mention in a previous issue, that it makes a cheap cost and close extraction, without roasting, and operates quickly in the recovery of copper, zinc and silver values from ores carrying these metals. Furthermore, we are assured that, in the case of zinc and silver, this solvent will extract the zinc or silver and leave the remaining metals fit for amalgamation or smelting in the same manner, as if no zinc had originally been present. In case minerals containing metallic copper or sulphides in large proportions are to be treated, it is advised that concentration be employed in connection with the treatment under consideration.

The actual veracity of our introductory statement as to the exclusive employment of sulphuric acid for the extraction of roasted copper sulphides is borne out by many cases, where there is supposed to be a secret about the method of treatment, which latter resolves itself usually, on closer investigation, into the simple lixiviation process by means of sulphuric acid or a modification thereof. Thus the extraction works at Clifton, Arizona, limit their leaching operations to the treatment of the tailings from the concentrating tables, and employ for this purpose a low-grade chalcocite, containing from 1.5% to 4%  $\text{Cu}_2\text{S}$ . This ore, when in a pure condition, carries the high percentage of 79.8 copper, the remainder 20.2 representing the contents in sulphur. The improvement or secret in their process, if such it can be called, consists in the production of sulphuric acid from a large body of iron pyrites, occurring in the vicinity—a procedure which has been frequently recommended by the writer in previous communications as a meritorious and money-saving addition to lixiviating works. The Clifton plant produces an acid of 66° Beaume, and it is generally understood that three parts of acid dissolve one part of copper, using dilute acid. The degree of solution employed in these works could not be ascertained by inquiry; but the above given points being at hand, a simple calculation will reveal the proportions of acid and water used. Since the sulphuric acid applied has 60° Beaume, it is identical with the commercial article obtained by the distillation of the chamber acid in sulphuric acid works, which possesses a degree of concentration equalling 65.5° Beaume, and is known to contain 8% of water. From the chemical formula

which shortly represents the reaction occurring, and the introduction of the atomic and molecular weights of copper and sulphuric acid, respectively, it will be seen that 98 parts by weight of absolute acid (100%) will effect the solution of 63.3 parts of copper in the presence of water. The acid applied in the Clifton works contains, however, only 92 parts of sulphuric acid in 100, so that the

equation

$$98 : 63.3 :: 92 : x$$

(x = 59.4 parts of copper)

will give the weight of copper dissolved by 100 parts of the special acid employed, which is 59.4 parts. From the equation

$$59.4 : 100 :: 1 : x$$

(x = 1.6 parts of sulphuric acid)

we learn, furthermore, that 1 part by weight of copper requires 1.6 parts of the acid used; and since the statement is made that 3 parts of dilute acid dissolve 1 part of the copper present, the dilution of the acid must take place in the proportion of 1.6 to 1.4, or about equal parts of acid and water.

The same leaching process, as described above, is

originated automatic machinery, jigs, gauges, the standardization of parts, etc., but they are able to see at once the great advantage to be got from their usage, and have the foresight and originality to apply labor-saving principles to any fresh department of manufactures they may take up. The term "cute and cunning Yankee" is wrong. He is not cute and cunning, but, to my mind, has an overpowering lust for the dollar and common sense.

When an American machinist or workman has an idea, the patent office is in easy access to his salary. The people are invariably glad to use some new idea, provided there is any little benefit in so doing, and not, as in England, pleased to find so many objections to an invention or scheme. If an idea will only save cents, it has the attention of most every man in its particular department in the States. In England, if the self-same idea would be introduced, people to whom it was shown would say: "Well, it may save a copper or two, but it is not worth while bothering with." And so it is in many departments of English manufactures. Detail is the keynote. If an American can see where a small saving may occur, a small improvement made in their manufactures, a better engraving or a more attractive way of putting their products before probable customers, any little scheme at all that will help, no matter whether it comes from a laborer, manager or president, or whether it is an English, German, French or Russian idea, it receives attention. I had an idea for a certain labor-saving device. I made a sketch, and showed it to the manager of the firm I was with here in the United States of America, explained it to him, and he was interested and saw its feasibility, told me to make a model in his tool room, and see how it came out. I did as he said, it coming out satisfactorily, after which I made application for a patent, which, if granted to me, will benefit me considerably. If the same proposition had been shown to a manager or foreman in England, it would very probably have been pooh-poohed.

In England great individuals have been born with very fertile brains—men whose names will never die; but it is not policy to rely on a few men. To encourage and not put down originality, let every man have his ideas considered, and make it worth while for the men to scheme and expedite things, and they will then maybe leave some of their narrow-mindedness and faith in trades unions as to output per man, etc. I know plenty of English and Scotch mechanics in this country that would much rather live in Great Britain if they had a "show" of getting on the same as they have here; they would rather live under a Government of clean politics, which gives law, justice and a proper interest to its citizens, such as England provides. In conclusion, any firm, corporation or nation which can produce per man a greater output than its competitors of articles of equal value will have most certainly the more prosperous people.

Therefore, English manufacturers, take on with new schemes or suggestions, and expedite your manufacturing; maintain and, if possible, better your products and cheapen cost. Let men have your attention so as to get the most out of them, put in good labor-saving tools, use templates, gauges, jigs; have convenient and properly built tools and have a systematic tool room and specialize. If an idea comes from a laborer, machinist or president, if it is an American, German or French proposition, provided it has merit, do not wait, but sail right in and use it. Be always on the lookout for new schemes, and ideas will evolve themselves. Advertise well and "pithy," use good illustrations and bring out the salient points of the machines or articles you produce, be it trivial or momentous. English manufacturers have the advantage of a fine geographical position, have a good and well-established business reputation and can not be approached yet in some of their industries. Therefore, do not get scared because you do not get orders for every quotation you submit. English manufacturers with the right kind of thought will always have a good living for themselves and the people dependent upon them. H. HARRAP.

GEO. F. WRIGHT, who returned on the steamer Pennsylvania from geological explorations in Siberia, says that at a place where he believes the children of Israel crossed the Red sea he found nothing to indicate that the soil was of glacial origin. His researches showed instead that the northern part of Asia had been within the age of man covered with from 750 to 3000 feet of water. On some mountains he found gravel at a height of 700 feet.

THE Geological Survey has begun work on the California-Nevada border involving ultimate expenditure of about \$10,000,000, distributed over a period of about ten years. The work will be mainly along the Truckee, Carson and Walker rivers. The corps will measure the volume of streams, capacity of possible reservoirs, and estimate the cost of building them.

A SACRAMENTO, CAL., telegram announces the appointment of L. E. Aubury of Los Angeles as State Mineralogist of California.

BEGINNING on the 1st inst., domestic rates of postage apply to all mail matter passing between the United States and Cuba.

## Mining and Metallurgical Patents.

Patents Issued March 26, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS  
ELECTRIC ORE CONCENTRATOR.—No. 670,440; H. M. Sutton and W. L. Steele, Dallas, Texas.

Combination with moving ore-conveying surface, of means for electrically charging same, exhaust device provided with hoods disposed above surface, electrically repulsive screens disposed between surface and hoods, feed hopper adapted to discharge upon moving surface, rocking shaker disposed between hopper and moving surface, receptacle to receive material discharged from surface.

STAMP MILL ATTACHMENT.—No. 670,549; L. R. Tulloch, Angels Camp, Cal.

Combination, with tappet and cam, of prop for tappet, bearing thereon, arm revoluble on bearing, roller carried by end of arm, movable block, lower vertical shaft section, upper vertical shaft section movable therein, means for causing shaft sections to rock in unison, arm on upper shaft section, link therefrom to first arm of such length that continuous movement of upper section produces reciprocating movement of roller to insert same between cam and tappet and withdraw same, arm on lower shaft section moving block beneath prop.

PUMP.—No. 670,868; P. J. Bode, St. Louis, Mo.

Pump to handle dredging material, working barrel mounted upon receiving chamber, plunger operating in working barrel, means for propelling plunger, suction valve placed in chamber formed on upper side of receiving chamber, discharge valve placed in discharge chamber formed on lower side of receiving chamber, arranged opposite one another, chambers

connected by inclined bottom, diaphragm mechanism communicated with suction valve for aiding operation, diaphragm mechanism operated by atmospheric pressure.

ROCK DRILL.—No. 670,750; W. Wood, Paterson, N. J.

A cylinder head, a gland fitting therein having flange, holding bolts securing gland to head, inwardly opening recesses in latter receiving heads of bolts, body portions thereof lying in slots opening into recesses extending axially through flange and receiving nuts on outer ends, whereby heads of bolts are locked in recesses by gland.

SOLAR GENERATOR.—No. 670,917; A. G. Eneas, Boston, Mass.

A solar generator comprising reflector having curved reflecting surface focusing at all points along straight line or focal axis, pivotal fixed supports for reflector at opposite sides thereof for diurnal movement of reflector, means for varying angle of focal axis relatively to fixed pivotal diurnal axis of reflector according to declination of sun.

GAS ENGINE.—No. 670,803; T. McMahon, Philadelphia, Pa.

A main shaft, a plurality of cylinders, pistons for cylinders, reservoir, pipes leading from lower portion of reservoir to lower portion of cylinders, and pipes leading from upper portion of reservoir to upper portion of cylinders, means for supplying gas to cylinders, means for controlling supply, valves in pipes arranged to permit gas to be forced from lower portion of one cylinder into upper portion of other cylinder through reservoir.

THE Cochiti G. M. Co., Bland, N. M., are operating by electric power transmitted 32 miles from a steam power plant at a coal mine. The cost of the transmitted power, a half more being used, is less than one-fourth of the steam power displaced at the mine, where wood had to be used for fuel.

THE U. S. Geological Survey is making a preliminary geological and mineral survey of Cuba at the expense of the Island Government. Dr. C. W. Hayes, T. W. Vaughn and C. Spencer are now beginning the work.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

That an ore sampling and reduction works will be established in White Horse next summer is asserted by E. C. Hawkins.

Dawson reports that during a recent stampede to Gold Run and Eureka eighty men staked one claim and made a rush to record it, and at the mouth of Gold Run 100 men made a similar scramble for three claims.

The February report of the Alaska-Treadwell M. Co. shows 25,540 tons ore crushed by 240 stamps in twenty-seven and one-half days, value \$38,370, and 510 tons sulphurets, saved, value \$22,720; gross yield for the month, \$65,090; ore yielding \$2.60 per ton; estimated expenses for the month, \$36,026.

The Crackajack mine, A. H. White manager, at Hollis, Prince of Wales Island, is producing high-grade gold-bearing quartz. The mine is opened by three tunnels, the lowest in 150 feet on the ledge. While carrying some free visible gold, the values are principally in iron and arsenical pyrite.

### ARIZONA.

#### COCHISE COUNTY.

The Copper Queen is now employing 1600 men, and their monthly output of bullion is not less, on an average, than 2000 tons per month, frequently running much more than this. The daily output sometimes runs as high as ninety tons. Much of their ores now run high in silver and gold.

Bisbee, March 26.

The Copper Queen mine, Bisbee, is located in a gulch or ravine which drains toward the east. On the north side of this gulch is a porphyry formation, wherein there has been a considerable amount of prospecting in shafts as deep as 800 feet, without as yet finding much ore of value. On the south side of the gulch is a great lime capping which overlies a vast copper ledge in a nearly horizontal position, but dipping slightly to the southeast. The Copper Queen, Calumet and other groups are embraced in this mineral belt. The ore bodies comprise vast deposits of copper carbonates, including much of the malachites and azurites and black oxides; and as the workings proceed southeastward they disclose immense bodies of copper sulphides, including pyrites and chalcocites. There is no regularity about the relative position of the two kinds of ore deposits specified. In the Copper Queen a carbonate ledge overlies a sulphide stratum in one place and the order is reversed in others, the two kinds usually being separated by a horse or roll of lime. But, in general, the sulphides appear to preponderate as the dip of the ledges are followed to the southeast. This theory is supported by recent developments in the Calumet and Arizona group.

The Copper Queen is worked through three shafts—the Czar, Holbrook and Spray. They range in depth from 750 to 850 feet and are all connected on the 200, 300, 400 and 500-foot levels. The underground work includes approximately 80 miles of drifts and crosscuts wherein car tracks are laid. The method pursued here is to stop on a face of ore from 30 to 50 feet high, timber up with square sets and fill in partly with waste. On some of the stopes, on the 200 level, is a temperature of probably 120 to 130 degrees, which is produced by the rapid process of oxidation that goes on as the ground is being broken. In these overheated chambers the air is good and of ample volume, but all effort to cool that section has been without success. The ground worked through is heavy, inclined to swelling, making timbering of the most thorough character necessary. The new Spray shaft is equipped with modern hoisting engines, and an up-to-date steel gallow-frame. At present no air drills are in use in the Copper Queen, the structure of the ledge matter being rather loose and easily broken. S. W. Clawson is mine superintendent.

There are five furnaces in operation at the Copper Queen smelter—four of the old round type and one of the Mitchell square type. The five are smelting about 800 tons of ore per twenty-four hours. There are four copper converters in operation and a fifth will soon be ready for use. The bullion produced contains some gold and silver with the copper. All ores above the 400 level were oxidized, carrying copper carbonates, but in some of the newer workings at 500 to 700 feet depth they get into a copper and iron sulphide, with about 24% of silica. The carbonates carry as high as 22% aluminum, which goes out in the slag. The sulphides and oxidized ores are mixed in the charge

about half and half. The slag is hauled away by a small locomotive and the molten material is handled from furnace discharge to converters by an electric crane.

The two flues, each 600 feet long, 8 and 10 feet in diameter, pass from the furnaces up the mountain side at about 45° elevation and are constructed of iron. The dust herein gathered runs about 8% copper. It is mixed with pulverized ore oxides, briquetted and returned to the smelter.

In making up the charge for the furnaces the sulphides are roasted, and largely desulphurized by Douglas roasters, before they are mixed with the carbonates. The product of the Copper Queen smelter is now running at the rate of about 3,500,000 pounds of bullion per month. James Wood is superintendent of the smelter.

The same parties who control the Copper Queen are building a railroad from Bisbee 100 miles southward into Sonora, Mexico, to their copper mine and smelter at Nacosero, which have been operating about eight months. Tracklaying on the new road is in progress, 10 miles having been completed. WASCOTT.

Bisbee, March 28.

The Lowell & Arizona Copper M. & S. Co. are developing a property south of the Copper Queen and Calumet, which is the direction in which the known ore body of the camp is supposed to dip. They have put up first-class hoisting equipment and have sunk a shaft 880 feet in the lime formation. Levels have been run on the 500, 600 and 800 levels, in all aggregating over 2000 feet of work. On the 800 level six different drifts have been run in as many different directions as prospecting work. The rock generally is an altered lime, but the work discloses streaks of oxidized manganese, decomposed quartz and one drift cuts through an immense deposit of siliceous conglomerate and wash material. As yet no ore of consequence has been found, but sinking will be continued to considerable depth. F. C. Fenner is superintendent, A. C. Daws mine foreman. Bisbee, March 29.

On the 1st at Tucson, M. Costello received \$500,000 in cash from the Lake Superior Co. for his copper mines at Bisbee.

#### GRAHAM COUNTY.

The Arizona Copper Co., James Colquhoun manager, smelts direct its first-grade ores, concentrates before smelting its second-grades and leaches the concentrator tailings which result from carbonate ores, the latter ores being concentrated separately from the sulphides. Of the 20,000 tons per month concentrated, the principal proportion is low-grade sulphides. The leaching process now in vogue here is the result of experiments and practice at this plant for a number of years and includes many features peculiar to this property alone. The record of production here shows that, while the grade of ores has diminished year by year, the method of extraction has constantly become more thorough. Seven to ten years ago ores running less than 20% were not smelted. To-day the plant operates profitably on ores that average no higher than 3½%. The product of the smelter here amounts to approximately 10,000 tons of copper bullion per annum, or at the rate of 1,666,000 pounds per month.

The concentrating mill is built in three sections, the result of additions and enlargements. The newest section is in a steel structure, with a vanner room 75x150 feet, containing thirty-six Frues, operated by a Union duplex gas engine. Another section contains twenty-one vanners; in another are fifteen Wilfey tables. In brief, the process comprises crushers, rolls, trommels, Huntington mills, vanners, recrushing of tailings to 1 millimeter fineness, the latter passing finally to the slime tables.

In the power house are five high-speed 65 H. P. gas engines, which operate five dynamos that run the blowers, twenty-one concentrators and other machinery. Four other gas engines operate the air compressors, and two others run generators which supply electric light. The compressed air is for the operation of the copper converters at the smelter.

Clifton, March 24.

WASCOTT.

#### MARICOPA COUNTY.

The Gold Coin M. Co. has incorporated at Phoenix, C. S. Hoover manager, to work a property 8 miles west of Kyrene, 14 miles south of Phoenix.

#### MOHAVE COUNTY.

The New Comstock M. Co. has been organized in Los Angeles by S. C. Baggett to operate near Kingman.

#### PIMA COUNTY.

In Boston is being floated 100,000 shares Catalina Copper M. Co. at \$2 per share. A circular signed by the company states it has \$600,000 capital stock and property near Tucson—claims 1 mile in length, ¼

mile in width—and that the proceeds of the stock are to be used for development work.

#### PINAL COUNTY.

L. D. York of Los Angeles, Cal., has bought a half interest in the Grand Central group, 20 miles east of Florence, for \$3000.

J. Rhifer and R. Monterey think they have found the extension of the old Silver King mine, near Florence.

#### CALIFORNIA.

##### AMADOR COUNTY.

Near Drytown the Centennial mine, Supt. Gross, is developing, drifting north and south from the 600-foot level. In the latter is a large body of low-grade ore.

On the Mokelumne river, 2 miles from Wallace, on the Holman ranch, a gravel proposition is run by electric power. The water is carried by a flume to the pay gravel, a steam shovel dumps the gravel—mixed with black sand—on a leather belt that sends up one cubic yard per minute. The flume carries 2600 inches of water.

The Amador Queen No. 2, J. R. Phillips Supt., has resumed operations. The Rhetta Con. G. M. Co. has incorporated, to mine near Plymouth.

The Kennedy mine, at Sutter Creek, now has three working shafts, all connected at or below the 2000-foot level, the north and east shafts having been just connected.

##### BUTTE COUNTY.

On the Big Butte placer, 25 miles from Chico, a third tunnel is being run to drain the property.

The Old Blackleg mine, near Chico, has been reopened.

The Pershacker, down 500 feet, is reported closed.

##### CALAVERAS COUNTY.

The Mead G. M. Co. will sink on one of its ledges near Rich Gulch.

The Sheep Ranch mine is running on high-grade ore, employing fifty men.

##### EL DORADO COUNTY.

Near Placerville the mill at the Church mine is operating five stamps.

##### KERN COUNTY.

The Standard Oil Co. is now reported to have storage capacity for 175,000 barrels oil in Kern River district. Twelve additional tanks would make the total capacity 400,000 barrels.

Ex-Congressman C. A. Barlow has bought of the Pittsburg for \$20,000 a forty-acre tract in the northwest quarter of 1, 11-24, not improved territory but locally considered a good buy.

Oil men expect the railroad companies will voluntarily reduce the charges on oil shipments to 30 cents a barrel to San Francisco.

The last cleanup of the Yellow Aster at Randsburg was the best for months. A pipe line is being surveyed to run the tailings from the 20-stamp mill to a tailing pond. Fifty stamps of new mill will be ready to start next week.

Long distance telephone connection has been made with Randsburg, Garlock and Johannesburg.

The tankage of the Kern River district is 700,000 gallons. The McKittick district is daily producing 2000 barrels.

##### LOS ANGELES COUNTY.

The Columbia Oil Co. has leased from the Union Oil Co. 100 acres of land lying west of the Santa Fe territory in the Fullerton field.

A controlling interest in the Cahuenga Oil Co. has been sold to Wm. Ferguson for \$14,000. The company's holdings consist of ten acres of land on which three wells have been drilled.

##### MADERA COUNTY.

The Rex mine at Grub Gulch has its stamp mill crushing good ore; the mill is run by gasoline engine.

The Savanna mine, at French, on the Fresno river, expects to operate its 10-stamp mill.

Grub Gulch, March 26.

The Spangle mine ore will be crushed by a new mill now about completed.

##### MARIPOSA COUNTY.

At Princeton the Grant people are putting in foundation for an additional mill.

##### MONO COUNTY.

The Arnot mine at Bridgeport, A. P. Sayre Supt., is to be worked on a more extended scale by Eastern capital.

##### NEVADA COUNTY.

The German mine has been examined and will be sold to Eastern men if the report is satisfactory.

The Boss mine, near Sweetland, is to be unwatered.

The Providence M. Co. has levied assessment No. 1.

The Yuba mine, at Maybert, is to be connected by telephone with Nevada City. It is thought that the new important

strike in the Champion mine at Nevada City, the ledge now 20 feet wide, will start all seventy stamps of the mill in operation.

An electric railway is again talked of between Grass Valley and Nevada City.

Supt. Jeffrey has a crushing from the Gold Blossom mine which yielded \$38 to the load.

The Centennial mine, on Osborn hill, is bonded by J. E. Carter.

Six practical miners have leased the Seven-Thirty mine at Deadman's Flat.

J. E. Carter has bonded the Centennial mine, Grass Valley, and is arranging to start work.

W. Campbell of Grass Valley has foreclosed a mortgage on the Slate Ledge mine at Forest Springs for \$13,600.

The shaft at the Bullion Con., G. Mainhart manager, Nevada City, is 1000 feet deep and will be continued deeper. The San Francisco people who were operating it under bond have completed the purchase.

P. C. Drescher is arranging for the re-opening of the Bellefontaine quartz mine at Nevada City. The shaft is down 350 feet and a larger pump is to be installed to sink deeper.

##### PLUMAS COUNTY.

O'Brien & Hammon have bought the Spanish Ranch mine.

The Spanish Ranch mine is reported sold to W. P. Hammon of Oroville and J. K. O'Brien of Marysville. Prospecting the mine by drill has been done for several months past.

##### SACRAMENTO COUNTY.

The Ashburton mine will resume operations near Folsom with its dredger machinery July 1.

##### SAN DIEGO COUNTY.

The boundaries of the new Colorado desert mining district were fixed last week at a miners' meeting at Carriso creek section; L. A. Wright president, H. E. Mills secretary.

##### SANTA BARBARA COUNTY.

The North Star Oil Co. has its wharf at Summerland out from shore 250 feet and will begin drilling on the ocean beach.

##### SIERRA COUNTY.

The Thistle Shaft Co., at La Porte, have started their tunnel toward the drift ground opened by the shaft.

##### SISKIYOU COUNTY.

At Callahans the Siskiyou Hydraulic M. Co., E. Boyer manager, has 100 men employed on two hydraulic plants at South Fork and Wild Cat.

Philadelphia men compose the Consolidated M. & D. Co., who propose building a dredger.

The Golden Star mine has been bonded to C. E. Brown for nine months for \$15,000.

The Oak Bar M. Co. has started up hydraulic operations under the superintendence of W. Bannister.

The Greenhorn No. 2 drift mine, at Yreka, is said to be bonded to W. T. Shurtleff, who will reopen it. At the Greenhorn No. 1 the tailings are being reworked and a new shaft is to be put down.

##### TRINITY COUNTY.

The Sweepstake M. Co., G. Hall, manager, Weaverville, is preparing to hydraulic their gravel mine. It is an old channel carrying coarse heavy gold. Mr. Hall says they will construct a 27-mile ditch from Canyon creek this summer.

##### TUOLUMNE COUNTY.

The tunnel in the Grand View gravel mine, below Montezuma, is completed.

At Jacksonville the Clio mine has resumed operations.

In the north drift of the seventh level of the Jumper mine a new ore shoot has been found.

Supt. Holland will put in new boilers and hoisting engine on the Providence.

The Confidence G. M. & M. Co. has incorporated at Sonora to buy the Confidence quartz mine and mill site, the Independence quartz mine and the Jessie and Edith quartz mines.

The Longfellow mine is temporarily closed.

L. Dondro has taken out \$12,000 in a few days from his old channel claim at Yankee Hill, near Columbia, close to where old owners of the claim had stopped work. One nugget weighed three and one-half pounds, value \$650.

The Golden West M. Co., R. Restano Supt., has bought a water right and proposes to operate the mine by electricity. A 10-stamp mill will be built this summer.

The superintendent's annual report of the Jumper states that 103,000 tons of ore are in sight, as against 100,000 the previous year. The shaft is down 1353 feet. The costs of mining, milling and development aggregate \$4.55 per ton, as compared with \$6.10 the previous year.

##### YUBA COUNTY.

Placer mining is to be resumed at Smartsville.—The Blue Point mine has been leased to San Francisco men.

## COLORADO.

## BOULDER COUNTY.

The B. & M. Co., at Ward, are preparing to sink from the 850 to the 1000-foot level.

Col. Brainard is running a tunnel from Camp Talcott to cut at depth the principal veins of Ward district.

The Ward Mountain tunnel, at Four Mile, Ward, has cut several rich veins that are now being mined through it.

## CLEAR CREEK COUNTY.

Gilean & Co. are shipping from their lease on the Independence at Georgetown. The slope they are working is 100 feet long, of high-grade ore, from 1 to 2 feet in width, containing bunches with considerable hesite mixed through the ore, the hesite carrying values up to \$20,000 per ton.

The Silver Age mine shaft has been unwatered and sinking will be resumed. The mill has been remodeled and four concentrators have been added.

It is reported that the Shively mine at Silver Plume is to be reopened by an Eastern company. The Pelican and Bismarck properties have been large shippers during March. The Vulcan and Kalamazoo are to be reopened by Denver and Ouray people. J. Butterfield is Supt.

## GUNNISON COUNTY.

The Chloride mine, Gunnison, is producing from 80 to 100 tons per month, averaging \$50, principally gold. The main shaft is to be sunk to the 300-foot level. The Cortland mine is taking out \$150 ore from a crosscut in the bottom of a new shaft. Sharpe & Severson are operating the Calumet and shipping \$100 ore. The Colorado S. M. & M. Co., Pitkin, is pushing development. The Silver Basin deep shaft in Chicago park is down over 300 feet and expected to soon reach the first ore-bearing contact. It is sinking for ore bodies discovered by the diamond drill in 1893.

The Colorado-California S. M. & M. Co., operating the Ruby Chief mine at Irwin, are sinking a shaft.

## HINSDALE COUNTY.

A strike is reported in the Golden Fleece, the tunnel at 2690 feet cutting 6 feet of galena, believed to be the old Enterprise vein. The strike is 800 feet below the surface.

## LAKE COUNTY.

Supt. W. Hollister of the President mine, Leadville, is sacking ores containing a percentage of bismuth. Herf & Ferrets of St. Louis, in addition to London buyers, are reported now buying bismuth in Leadville.

At Leadville, Supt. J. Nimon of the Home mines has 125 men at work. The daily yield is 325 tons of iron and some lead carbonate ores. The most of this material is sold upon controls carrying twelve ounces silver associated with 50% iron excess, netting about \$6 per ton.

The Leadville Pumping Association is suing the Midas and the Augusta M. Cos. and J. F. Campion for \$5221.82 alleged due as their proportionate amount for unwatering the down town mines in 1896.

On the 1200-foot point in the main incline of the Little Ellen at Leadville a pay streak said to be 1 foot thick was uncovered assaying fourteen ounces in gold.

Manager Newell says the north upraise from the main level in the California Gulch shaft at Leadville has reached the top of the lime, finding a streak of iron that carries thirty ounces silver per ton.

The Bonanza G. M. & M. Co., Leadville, has been organized to work Doctor group; W. E. Newton Supt. Machinery will be put on and the property developed.

## PARK COUNTY.

The Bonanza G. M. & M. Co., on the Doctor group, Pennsylvania mountain, will do considerable work this season, W. E. Newton, superintendent.

Several companies will work the placers along the Platte river by dredging this summer.

## SAGUACHE COUNTY.

The Crestone Mineral Co. has purchased the Hopkins property at Crestone and will start development at once. Much of the ore is free milling and as soon as sufficiently developed a mill will be bought.

## SAN MIGUEL COUNTY.

The Keystone Hydraulic M. Co., E. L. Davis manager, says the construction of the company's hydraulic plant will begin soon.

At Telluride, the Tom Boy Co. will erect an aerial tramway 800 feet long from the Argentine to the Columbia-Menona mill and will put the mill in shape for crushing. It is locally reported that the Tom Boy Co. has purchased all the Columbia-Menona holdings.

The Crown Point group at Ophir has been bought for \$40,000 by a Milwaukee company. G. R. Dolph is manager. Development work is being pushed.

The Alta, in Turkey Creek basin, is

shipping a car of ore per week that carries 100 ounces in silver and 30% lead, beside values in gold. The gross value per car is \$900, net \$700.

The La Sal Copper Co. at Cashin is completing a mill to operate the calcium-hypophosphite leaching process for treating low-grade silver-copper ores that cannot be shipped profitably.

Morrison & Elliott, leasing the Sheridan dump, say an addition of five stamps will be made to their mill, making it fifteen stamps.

## SUMMIT COUNTY.

Manager Wood says the Cashier mill at Breckenridge is treating fifty tons of quartz daily, and that the cyanide plant is completed and will start immediately. The Iron Mask has a few men working in the lower tunnel, cleaning out and re-timbering. P. L. Cummings and H. Litton have started on the Liberty tunnel, driving for the Liberty vein.

## TELLER COUNTY.

At Victor, W. S. Stratton has suspended operations on the east shaft of the Lucky Guss.

Cripple Creek reports a production of 100 tons a month from the Santa Rita, on Squaw mountain. The grade of ore is from 1.20 to 15 ounces.

The Independence is increasing its production and doing a large amount of exploration work; month's production is estimated at \$250,000—an increase of 25% over the output of recent months.

Wilson & Dalzell, leasing the Vindicator at Cripple Creek, have completed enlargement and timbering the Pinkerton shaft. They have a depth of 250 feet and will continue to 700 feet before drifting. The lease requires sinking to 700 feet, but allows two years' operation afterward.

A strike has been made in the Vindicator, Victor, east of the shaft at a depth of 900 feet.

The 115-foot level of the New Haven, Victor, is opened 120 feet south and 60 feet north. The east vein has been followed 40 feet on this level and shipping ore obtained. The 200-foot level is opened north 65 feet and a further advance of 25 feet is expected to reach the Parkins ore shoot.

On the Wire Gold, Victor, at a depth of 50 feet a crosscut has been run 20 feet west on a granite and phonolite contact, and thence into the latter, following a 3-foot vein from which a trial shipment will be made.

The Stratton-Cripple Creek M. & D. Co. has incorporated, capitalized with 20,000,000 shares, par value 50 cents.

The German-American Co. are shipping from the Ophelia tunnel, Cripple Creek, at a depth of 240 feet. The pay streak is more than 1 foot wide and has been opened about 180 feet.

It is reported that work will soon be started in the shaft of the Plymouth Rock, Cripple Creek. The shaft is down 1065 feet; its prospective depth is 2800 feet.

In the Elkton at Cripple Creek the mine is being unwatered and it is believed will be clear for the resumption of work in the lower levels by May.

The dumps at the Independence are being worked by leasers. F. Herman has dump No. 1, containing the waste taken out during the opening of the mine by Stratton. He handles 300 tons a day, making a gross output of \$2500 a month, which pays a fair profit.

In handling the dump the rock is first hand-sorted, passed over a 1-inch mesh screen and then a second screen of 3/4-inch mesh. It is then sorted a second time and passed to a "washer." The slimes are collected in two settling tanks, the water being reused to avoid loss. A third sorting is then made. About 4% of the dump handled is ore.

Murray & Co. have the second dump, which receives the present waste of the mine. About the same amount of rock is handled daily, but it is reported that higher ore values are sorted out. The Gilpin & Cripple Creek G. M. Co. has installed a battery of air drills on the Atlanta claim.

Operations are confined to sinking the shaft, now down 440 feet. When the 500-foot point is reached a crosscut will be run east and west for the purpose of thoroughly exploring the property. Schoolcraft & Co., leasing on the Atlanta, crosscutting at the 100-foot level, have opened up a dyke which assays well. Three miners leasing a fraction of the Atlanta are drifting on a 3-foot vein, assaying \$20 to the ton. The Accident, at Cripple Creek, S. McDougal owner, is to start up.

## IDAHO.

## ADA COUNTY.

Near Boise, Chas. Balbach, manager Homestake mine, will operate the 10-stamp mill this season. G. W. Bredehoff, manager the Daisy, has a 200-foot shaft, and will shortly start the 10-stamp mill.

## BOISE COUNTY.

At Idaho City the War Eagle Co. have

resumed operations in their East Hill placers.

F. Carpenter, of Idaho City, is to operate a placer claim at Grimes' Pass, which the Ingle Q. M. Co. recently bought.

## IDAHO COUNTY.

The collection of mineral exhibit for the International Mining Congress, to be held in Boise in July, will be in the hands of State Mine Inspector Jacobs.

## NEZ PERCES COUNTY.

Twenty tons of ore from the Dewey, at Lewiston, expected to net \$10,000, are stated to have been shipped to the smelter.

## OWYHEE COUNTY.

Near Silver City Getchell & McKinnon report bonanza ore in their Bullion claim, south of the Potosi mine.

## SHOSHONE COUNTY.

At Wallace, in the Amador the crosscut from the bottom of the shaft has cut the ledge and 4 feet of ore found without getting across the shoot.

The Mammoth M. Co., at Wallace, will discontinue Sunday work, closing down with the day shift on Saturday. The plan of working only six days in the week will have much the same effect as reducing hours.

## WASHINGTON COUNTY.

The Boston & Seven Devils Copper Co. is locally credited with intention to erect a 100-ton smelter plant at Landor.

## MONTANA.

The Kennett M. Co. is locally credited with intention to put a new hoisting engine and other machinery on the mine and start a new perpendicular, double-compartment shaft to be sunk 1000 feet.

## BROADWATER COUNTY.

Near Townsend, H. C. Wilson is spending considerable money running bedrock flumes and will hydraulic this season.

The Stockton Copper M. Co., operating near Radersburg, has bought the North Star group; J. Rothfus, general manager.

## DALY COUNTY.

An injunction issued in the Heinze litigation has compelled the Boston & Montana to suspend work on the Leonard mine. About 300 men were laid off. Heinze claims that the veins upon which the Boston & Montana has been mining in the Leonard, Gambetta and Piccolo belong to the Minnie Haley, in which he owns an interest.

## FERGUS COUNTY.

Finch & Campbell, of Spokane, have bonded for \$450,000 the Kendall mine, an open quarry 125 feet wide, 40 feet high. The ore averages \$10 in gold per ton.

## FLATHEAD COUNTY.

In the West Fisher mining district, the new town of Foundation is a flourishing little camp. So fast is it growing that it has a newspaper but up to the present time no postoffice.

Manager O'Brien of the Fisher Creek Co. will start the mill this week and more stamps will be added.

The American Kootenai M. Co. has fifteen miners doing development work. Manager W. J. Beager states the mill will be running on ore about April 15. In the face of tunnel No. 1 a new strike of rich ore is reported.

Cleveland, O., men have bought the Mother Lode group and will put in modern machinery. Libby, March 27.

A rich strike is reported from the West Fisher district, near Foundation. The ore runs high in gold and is free-milling.

## GRANITE COUNTY.

At Garnet, Supt. Mussigbrod will increase the capacity of his mill from ten to twenty stamps.

## JEFFERSON COUNTY.

The Oconto and Consberg groups have been bonded. The mines are opened by a 600-foot tunnel, which will be continued; T. H. Mitchell is the Supt.

## LEWIS AND CLARKE COUNTY.

A strike is reported in the Howard mine, 2 miles above Helena; ore is said to run over \$150 a ton; C. A. Sheldon, manager.

M. W. Alderson has bonded the Daylight mine, near Unionville.

## MADISON COUNTY.

F. J. Dahler of the Ajax mine, Silver Star, has a carload of ore that goes \$300 gold to the ton.

The Porphyry gold mine, at Pony, has been bonded for \$15,000, and the purchasers have put a shaft down 100 feet.

## MEAGHER COUNTY.

The bond for \$150,000 on the North Pacific and Darling Fraction mines at Copperopolis was paid March 1st. These mines have been shipping copper ore 18 miles to the railroad.

## PARK COUNTY.

At Cowles P. O., E. H. Cowles, Supt. Ethan Allen mine, will put an additional

twenty stamps in the mill before the end of the year, to be running the mill and mine machinery by electricity, from a plant to be erected on Basin creek, 3 1/2 miles from the mine. McNulty Brothers, who operate the Natural Bridge Gold & Copper Co. mine and mill, 20 miles above the property, are going to add ten stamps to the mill.

## SILVER BOW COUNTY.

In Butte it is said that a syndicate with O. H. P. Belmont at the head is being formed, with a capital of \$10,000,000, to acquire the copper mines now in litigation between T. A. Heinze and some of the properties of the Amalgamated Copper Co. The Nipper and the L. E. R. are two of the biggest mines involved. It is said that T. A. Heinze will receive \$4,000,000 for his interests in the syndicated mines and that the Amalgamated Copper Co. will take stock to the extent of their present interests in the mines. It is believed that the deal will close the litigation over a number of Butte mines.

## NEVADA.

## ELKO COUNTY.

A new postoffice is established at the Cottonwood copper mines, called Azurite.

## HUMBOLDT COUNTY.

The Morrison M. Co.'s property, 5 miles from Humboldt, will be developed this season.

## LANDER COUNTY.

The Nevada Co. at Berlin has the 25-stamp mill in constant operation.

## LINCOLN COUNTY.

The Nevada & New England M. Co., with its mines and mill at Homestake, has closed down.

## WASHOE COUNTY.

Thirty-one cars ore have been shipped from the Wedekind mine, near Reno, since July 17, 1900.

Eighteen men are employed at the mine at Bryan City, near Reno.

## NEW MEXICO.

## SIERRA COUNTY.

P. R. Smith of New York has bought the Charter Oak mill at Hillsboro.

## OREGON.

## JOSEPHINE COUNTY.

The Victor Jr. mine, C. W. Thompson Supt., near Leland, is working sixty men. The vein, which varies from 1 inch to 9 feet, is in diorite and is opened by four crosscut tunnels, the lowest of which is down 271 feet on the ledge. From this tunnel a shaft is now down 100 feet. The hoisting plant set in the tunnel is operated by compressed air. The 15-stamp mill is working thirty tons of ore daily.

## SOUTH DAKOTA.

## LAWRENCE COUNTY.

At Lead the Hidden Fortune M. Co. is organized; general manager, G. M. Nix, Deadwood, who proposes to develop the property and erect a 200-stamp mill.

Eight miles south of Deadwood the Custer Peak M. Co. will develop, near Custer's peak, property that shows free milling ore averaging \$6 per ton gold in the slates. The company owns two mill sites and will erect a stamp mill this spring on Box Elder creek.

## UTAH.

The total mine and smelter output of Utah mines for March aggregated in value \$2,219,097.

Utah mines paid dividends amounting to \$229,500 in March.

## BEAVER COUNTY.

In the Horn Silver mine at Frisco a strike in new ground, 300 feet from the old workings on the 800-foot level, is reported. The ore carries copper.

## IRON COUNTY.

The Ophir mill at Stateline, Manager Lathrop, will provide for the treatment of 100 tons daily, the ore to be handled entirely by gravity.

## JUAB COUNTY.

The ore shoot from which the Eagle and Blue Bell at Eureka has been shipping is cut in the west drift from the winze 50 feet below the 350-foot level. The lead values are principally in sulphide. The east drift shows indications of the close proximity of ore.

## SALT LAKE COUNTY.

The property of the New Mammoth M. Co. is now in possession of Michigan men, represented at Bingham by F. H. Lathrop. The Shawmut Co. has its electric power plant in operation—the first set of electric power drills ever in Utah.

The Bingham C. & G. M. Co. has bought control of the Grand Central mine. The price is said to be \$1,200,000. This company treated in March 7960 tons of ore, producing about 1200 tons of matte worth about \$120,000. Two furnaces were in

blast. The third furnace blown in will increase the daily tonnage to 450, with ore in sight to provide for it.

Work is to be resumed in La Reine, at Tintic; C. T. Allen manager.

The Sioux-Ajax tunnel, W. J. Craig manager, is to be opened. Several claims are to be prospected through it.

It is stated that the Centennial-Eureka and United States companies are to consolidate the two properties and that they have been examined to determine the terms.

The Dalton & Lark mines, at Bingham, are reported to have been sold for \$750,000. Chicago parties are to operate the thirty-four claims making the property. The company is to be reorganized and extensive changes made, possibly a smelter to be built for the ores.

#### SUMMIT COUNTY.

The Daly-West, Park City, in March earned over \$100,000, from which, after paying \$45,000 dividends, over \$20,000 was added to reserve. A. W. Mountney, assistant secretary, reports incline moving toward 1600-foot level from 1200, carrying an unbroken body of ore.

On the Steele Group, at Park City, the tunnel is in 300 feet on a lime and quartzite contact. At the Comstock the 300-foot station has been completed and cross-cutting for the vein commenced. The Quincy mine has received two carloads of machinery.

#### TOOELE COUNTY.

The Mercur Miner reports not an idle man in the camp, all the mines working full-handed and full time.

The Con. Mercur Co.'s mill at Mercur treated during March 27,000 tons. F. Janney, Supt. of the mill, says that 65%—19,000 tons—was of sulphide ores. He says he prefers them as a milling proposition to the oxidized ores, finding results more uniform, owing to the roasting eliminating the refractory qualities, which would cause loss of values. The Sunshine Co. have given an option upon their mine and mill for \$300,000, of which \$5000 was paid down. The purchasers propose beginning the work of reopening the mine and fitting up the mill without delay. The control of the Ontario mine is reported to have been sold on a basis of \$1,800,000 for the property. The Camp Floyd Electric Co. has incorporated to furnish electric light to Mercur.

#### WASHINGTON.

##### FERRY COUNTY.

A contract is said to have been let for the construction of a smelter at Curlew, about 8 miles north of Republic.

The Quip of Republic camp has so far shipped 194.3 tons, claimed to have a gross value of \$6254. The average value would be about \$36 per ton.

#### KITTITAS COUNTY.

Ellensburg reports that a gold nugget worth \$1100 was found last week in the Hanten-McCauley mine, in the Swauk district.

#### OKANOGAN COUNTY.

R. Boettcher, manager Milwaukee-Okanogan G. M. Co., Weheville, has resumed work on the Fargo tunnel. He will also sink a shaft on the Lisbon.

#### PIERCE COUNTY.

The Montezuma M. Co., of Carbon river, say that the tunnel is now in 200 feet and the vein widening and increasing in richness.

#### STEVENS COUNTY.

The U. S. Supreme Court, in the case of the Mountain View claim, the first property staked on the north half of the Colville reserve, reverses the decision of the United States Court of Appeals and remands the case to the Stevens county Superior Court for trial. The question is whether a legal mineral location could be made on the reserve in advance of the President's proclamation. The suit has been in the local land office, to the Commissioner of Public Lands, to the Secretary of the Interior, back to the Superior Court, into the Federal Court, then to the Court of Appeals, later to the Supreme Court, and back again.

The Stella mine, near Blue creek, is being developed with a steam hoist and drill.

A deposit of iron at Valley has been opened and shipments will be made to the Tacoma smelter for use in fluxing.

The Golden Era M. Co. is soon to begin development on its property in the New Era district.

The United States Marble Co. of Valley announces a dividend; marble is shipped to Chicago.

## FOREIGN.

#### BRITISH COLUMBIA.

At Rossland the War Eagle mine during 1900 shows the following values and smelter charges: Real or full assay value—total metallic contents at full New York quotations, \$19.08; indirect smelting

charge—difference between New York quotations and smelter's prices for the metals, \$4.68; direct smelting charge—including freight from the mine, \$6; total smelting charge—direct and indirect, \$10.68; smelter's gross assay value—after deducting indirect charges only, \$14.40; smelter's net value—after deducting both the indirect and direct charges from the real assay value (i. e., net value of ore f. o. b. cars at mine), \$8.40.

The Le Roi mine, at Rossland, for the month ended Dec. 31, 1900, made shipments to the Northport Smelting Works as follows:

|                      | Tons.    |
|----------------------|----------|
| 200-foot level ..... | 371.18   |
| 300-foot level ..... | 696.78   |
| 350-foot level ..... | 8.11     |
| 500-foot level ..... | 2,489.72 |
| 600-foot level ..... | 3,639.14 |
| 700-foot level ..... | 5,529.70 |
| 800-foot level ..... | 1,696.37 |

Total.....14,431.00

7,743.19 ounces gold, at \$20, \$154,863.80, or \$10.73 per ton; 15,550.14 ounces silver, at 60 cents, \$9,330.08, or 65 cents per ton; 488,804 pounds copper, at 16½ cents, \$80,652.66, or \$5.59 per ton; making the total gross value \$244,846.54 and the average value per ton \$16.97.

The Granby smelter, at Grand Forks, by Sept. 1 will double its present capacity and will add 300 H. P. to its present power plant.

The Kootenay miners have sent a delegation to the Canadian Parliament to secure a bounty for the lead production similar to that given in Canada to steel production. A \$5 a ton bonus is to be asked on all lead mined and refined in Canada.

The Arlington, Slocan, has shipped 1000 tons since January 1; output since October 1 last, 2300 tons, valued at \$124,000.

#### MEXICO.

S. J. Sullivan, manager Santo Domingo mine of the Chihuahua M. Co., has his 200 tons daily of sulphides treated by the Guggenheim plant. He and nine others have bought 200 acres of mining land adjoining the Santo Domingo, paying \$260,000 cash.

Boston capital is reported to have bought the Santa Rosa mine in Sonora. It is an old mine with five veins from 2 to 16 feet wide. The new owners have started a shaft which they propose to sink to 150 feet and crosscut from to explore the veins.

At the San Francisco mine, J. C. Underwood manager, at Llano, Sonora, new machinery is being erected, and a cyanide plant is under consideration to work accumulating tailings.

#### SOUTH AFRICA.

The total gold output of companies making returns to the Rhodesia Chamber of Mines for the month of February amounts to 12,237 ounces, an increase of 1450 ounces as compared with the previous month, and an increase of 6004 ounces as compared with the corresponding period of 1900.

About 400 stamps are in present operation at Johannesburg.

The military authorities have given permission for four of the Rand mines to reopen, provided no higher rate of wages is paid than the soldiers are receiving, 5 shillings and rations.

#### Recently Declared Mining Dividends.

#### Books Received.

"Steam Boiler Economy," a treatise on the theory and practice of fuel economy in the operation of steam boilers, 8vo, 468

pages, 126 illustrations; Wm. Kent. The subject is treated in a practical way and with an intelligence, personal experience and knowledge of the subject that would make the work of value to any one interested in the subject. Published by John Wiley & Sons, New York City; price \$4.

#### Personal.

P. J. CIRKEL of Minneapolis, Minn., is visiting Utah.

D. G. LINARES has returned from Old Mexico to Victor, Colo.

LOUIS JANIN has returned to San Francisco from Grass Valley, Cal.

Wm. A. CHURCH is inspecting the Shannon mine, near Safford, Ariz.

G. B. EARNSHAW has resigned as Supt. Shawmut M. & M. Co., Bingham, Utah.

I. TRUMBO has resigned the receivership of the Golden Cross M. Co., Hedges, Cal.

JOHN L. SCARLETT of London, Eng., is examining property in West Fisher, Mont.

G. B. EARNSHAW, Supt. Shawmut M. & M. Co., at Bingham, Utah, has resigned.

B. LANGRIDGE has been appointed consulting engineer of the B. & M. mine, Ward, Colo.

N. O'BRIEN, from Virginia City, Mont., is elected manager Fisher Creek M. Co., Libby, Mont.

W. J. BEAGER, formerly of Butte, Mont., is now manager American Kootenai and Mother Lode mining companies, Libby, Mont.

G. S. PITCAIRN, metallurgical engineer of the Tharsis Co. of Spain, is visiting Clifton, Arizona.

GEO. H. JONES has accepted the superintendency of the Keystone Co., Gold Mountain, Utah.

J. F. BEITMAN, M. E., is examining copper deposits in Unaweep canyon, Montrose county, Colo.

B. STANLEY REVETT goes this week to the west coast of Mexico to examine placer mines there.

F. S. ROUMAGE is in Atlin, B. C., superintending the installation of a large hydraulic mining plant.

R. A. PARKER, M. E., has changed his address from 8 Congress St. to 4 P. O. square, Boston, Mass.

A. HAUMAN has gone from San Francisco to Las Animas mine, near Sonora, Mexico, as metallurgist.

W. W. TINER of Placer county, Cal., will shortly return from an extensive placer mining reconnaissance in Siberia.

WM. MOOREHEAD, formerly Supt. Dreisam mine, Tuolumne county, Cal., is now Supt. Yellow Aster, Randsburg, Cal.

ARTHUR WILLIAMS, formerly of the Mercur mill, is to take charge of the Century Co.'s plant in Park valley, Utah.

J. Q. McDONALD, manager National mill, Florence, Colo., has similar position at the new sampler of the Cripple Creek Co.

CHAS. W. PAULY succeeds I. Trumbo as receiver Golden Cross M. Co., at Hedges, Cal., with bond fixed by the court at \$25,000.

J. E. SPURR of the U. S. Geological Survey has gone to Turkey, under a special commission from the Turkish Government.

R. B. ESTEY AND NORMAN ESTEY have resigned as manager and general superintendent, respectively, of the Rialto M. Co., Leadville, Colo.

JESSE J. MACDONALD has again taken up the California and Arizona agency of Gold & Silver Extraction Co. of America, Ltd. His headquarters will be 128 North Main street, Los Angeles, Cal.

F. H. RICHARDS succeeds C. L. Vawter as U. S. Marshal of Alaska, second division. His jurisdiction will extend over the second division of the Alaska district, which comprises northwestern Alaska, taking in Dutch Harbor, Unalaska, the Kuskokwim and from the headwaters of the latter river to the Arctic, including the Koyukuk. His official headquarters will be at St. Michael, but he will spend most of his time in Nome.

#### Trade Treatises.

Advance Sheet No. 9 of the Jeaneville Iron Works Co., Jeaneville, Pa., gives minute detailed attention to working data on steam pumps; tabular data of value to steam pump users.

The A. Van Der Naillen School of Practical Engineering—a well written practical and finely illustrated treatise on the scope of the school's work, with several pages of testimonials from former pupils; sent on application to the new address, 113 Fulton St., San Francisco, Cal.

#### List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,  
PIONEER PATENT SOLICITORS  
FOR PACIFIC COAST.

FOR THE WEEK ENDING MARCH 26, 1901.

- 670,525.—FRUIT PACKING DEVICE.—C. W. Arrasmith, Courtland, Cal.  
670,602.—SHINGLE MACHINE.—D. F. Baker, Mt. Tabor, Or.

670,435.—HARNES.—W. F. Schatz, San Diego, Cal.  
670,543.—FIRE ESCAPE.—W. H. Sliger, McMinnville, Or.  
670,521.—VOTING MACHINE.—St. Louis & Barceloux, Willows, Cal.  
670,544.—STAMP MILL.—L. R. Tulloch, Angels Camp, Cal.  
670,825.—LETTER BOX.—W. L. Vestal, San Bernardino, Cal.  
670,652.—EYEGLASSES.—H. F. Wallace, Los Angeles, Cal.  
670,908.—POWER TRANSMITTER.—F. S. Weatherly, Los Angeles, Cal.

#### Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SHOE LACING CLASP.—No. 670,561. March 26, 1901. E. B. Hoegemann, Oakland, Cal.

This invention is designed to secure shoe laces without tying. It consists of two spring-actuated circular jaws having concentric rows of teeth adapted to register, and means by which the device may be secured to the shoe so that these parts being hinged at one side may be closed to clamp and lock the strangs between the serrated meeting edges.

FRUIT PACKING DEVICE.—No. 670,525. March 26, 1901. C. W. Arrasmith, Courtland, Cal.

This invention is designed to facilitate the packing of fresh fruits, such as berries, cherries, etc. It consists of a framework having an opening in which is a concaved slidable bottom with means for adjusting and holding the same; means for holding a fruit receptacle inserted above and covering this opening so that the concaved bottom being first filled with the fruit to form the crown the remainder is filled through the bottom of the box, which is afterwards permanently closed, and the device being inverted the basket is released, and is ready for market with the proper symmetrical crown of fine looking fruit.

RURAL SIGNAL DEVICE.—No. 670,833. March 26, 1901. F. C. Bates, San Jose, Cal., assignor of one-half to W. G. Hawley, same place.

This invention is designed for use in rural or suburban districts for the purpose of notifying grocers, butchers, etc., when they are desired to call at any house on the route. It consists of boards carried in a suitable frame having printed

**FOR SALE.****FOR SALE.****ONE COMPLETE PLACER MINING DREDGE OF THE ELEVATOR TYPE.**

With buckets having capacity of seven and a half cubic feet. Dredge only used few months. Located on Grasshopper creek, near Bannack, Mont. For full particulars, address THE BUCYRUS COMPANY, South Milwaukee, Wis.

**MACHINERY BARGAINS.**

I have some splendid Air Compressors, Hoisting Engines, Rock Drills, Rock Crushers, Channeling Machines, Steam Pumps, Boilers, Steam Shovels, Locomotives and Relaying Rails, all in splendid condition. Send for printed list and specify your requirements. I can save you money.

**WILLIS SHAW,**

627 New York Life Bldg., CHICAGO.

**FOR SALE.****20-Stamp Mill.**

Strictly Modern.

Little Used.

Built by Fraser & Chalmers.

**ANY PART OF THIS MILL WILL BE SOLD.**

This 20-stamp mill is located at Ohio City, about 25 miles east of Gunnison, Colorado. We are dismantling this mill for shipment to Denver and will quote prices on any part of the mill f. o. b. cars Ohio City, Colorado, and guarantee to make prompt shipment. The construction of the mill was of the best, both in machinery and buildings. The total cost of machinery and buildings, which we have bought, was \$130,000.00. Why was it sold? Simply another case of a mill without a mine. All correspondence should be addressed to our Denver office.

20 STAMPS. 850-lb. rapid drop, complete with frames.

2 BOILERS, 44 in. x 12 ft.; 30  $\frac{3}{4}$  in. flues.

2 BOILERS, 44 in. x 12 ft.; 34  $\frac{3}{4}$  in. flues.

(Boilers are set in batteries of two, half fronts, two stacks.)

CORLISS ENGINE, Fraser & Chalmers, 175 H. P.; cylinders 18x42 in.

FEED WATER HEATER, 30 in. x 9 ft. (F. & C.)

NO. 5 KNOWLES PUMP, 7x4 $\frac{1}{2}$ x10.

NO. 3 KNOWLES PUMP, 5x3 $\frac{1}{2}$ x7.

BLAKE CRUSHER, 7x10.

6 AMALGAMATING PANS, 5x4 ft.

3 SETTLERS, 8x3 ft. 4 in.

1 CLEANUP PAN.

4 QUICK FEEDERS.

3 AMALGAM SAFES.

1 AMALGAM CAR.

2 MEECH SYNDIATORS, new.

2 MEECH AMALGAMATORS.

3 MEECH SETTLERS.

HOWELL IMPROVED WHITE ROASTING FURNACE, 60 in. x 27 ft.

BANCROFT PULVERIZER, 40-ton.

REVOLVING ORE DRYER (F. & C.), 42 in. x 18 ft.

6 AUTOMATIC ORE FEEDERS.

1 RETORT AND BULLION FURNACE.

EXTRA STAMP AND FEEDER REPAIRS.

**ORE BUYERS AND EXPORTERS. MINING SUPPLIES.**

**A HARD TEST.** Cincinnati, Ohio, U. S. A. Burt Mfg. Co., Akron, Ohio.

Gentlemen:—We have tested the filter, running through some of the very rank oil that comes from our spindle

borings and automatic screw machines, and find it all right, and you will please forward six (6) more at once as per our understanding. Very respectfully, The Lodge & Shipley Machine Tool Co.—Wm. Lodge.

There's no test too hard for the **CROSS OIL FILTER.**

We guarantee to save you 50% on your oil bills. Why not try it for 30 days. If not all we say, send it back at our expense.

**THE BURT MFG. CO.,** Akron, Ohio, U. S. A.

Largest Mfrs. of Oil Filters in the World.

We also manufacture the **BURT EXHAUST HEAD.**

**SOLAR HOUSE LIGHTS**

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs **\$4.00** Per Light

**EACH LIGHT LASTS A LIFETIME**

Gives a steady light, brilliant as electricity, and whiter. Equals any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle"—jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasoline. No accident of any kind possible, and the whitest, steadiest and richest light that is known.

Write us for particulars.

## MODERN TEN-STAMP BATTERY.

Copyrighted.

The illustration shows the details of a modern 10-stamp battery of the back-knee type, driven by belt and tightener from a shaft located upon the battery frame sills below the mortars and plainly illustrates not only the battery and its various parts, but also shows the ore-bin gate, feeders, copper apron plates and water piping, all in their relative positions.

**50 Horse Power**

## TRACTION ENGINE.

~~~~~ FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS. ~~~~~

Capacity of Engine, **50 HORSE POWER.**

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,

THE "PELATAN-CLERICI" PROCESS

OF TREATING REFRACTORY ORES

General
Arrangement
of
Pelatan-Clerici
Plant.

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

FOR PARTICULARS, WRITE TO

THE RISDON IRON WORKS,
SAN FRANCISCO, CAL.
AGENTS.

The JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

WOODBURY'S SIDE SHAKE CONCENTRATOR.

THIS Concentrator is superior to any other Belt Machine. It has an iron frame, steel shaking frame, and built in the most thorough manner. The patent distributing device distributes the pulp evenly over the whole working surface of the belt; thereby it enables the machine to perform perfect work, and giving more capacity to the Concentrator than any other Belt Machine. The variable eccentric crank gives the machine greater capability to work different classes of ore. I will warrant this machine as having more capacity than any other Concentrator.

Simple in Its Construction - Saves Fine Sulphurets -
Without Loss in Tailings
= Makes High Product = Capacity from 5 Stamps

GATES IRON WORKS

The Copper Furnace herewith reproduced is one of two sold to the GRANBY CONSOLIDATED MINING AND SMELTING CO., LTD., BRITISH COLUMBIA. The size is 44x160 inches. These two furnaces were sold on a guaranteed capacity of 500 tons per day. Before the furnaces had been in operation a month they developed an average capacity of 600 tons per day, and the highest daily record has exceeded 735 tons. The cost of operation has steadily declined under the management of General Manager Hodges, until six-dollar copper ore is paying a handsome profit.

All of GATES IRON WORKS machinery is as good as it is represented to be, and often much better. We build every modern type of apparatus for the reduction of the precious ores by every established process. Our three great lines are these:

**Mining
Machinery,
Rock and Ore
Crushing
and
Cement
Machinery.**

SAN FRANCISCO, CAL.

THE SNODGRASS COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the most successful machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the Cement or Clay, and saves the Gold although it is as fine as flour. It is only necessary to have from 4 to 6 miner's inches of water to work 150 tons or more every twenty-four hours. The machinery consists of two iron troughs or "concaves," each 26" in diameter, one of which is about 18' and the other 12' long. In these troughs are strong revolving shafts with projecting teeth, made of White Iron, 2 1/2" wide by 1 1/4" thick, placed in spiral form around the shaft about 2" apart, forming a conveyor. The first shaft is geared to make from 150 to 250 revolutions per minute, and the second one from 300 to 500. There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly. There is a space of about 4" in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is free, it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made. In many cases the 18' machine alone is needed, as the two are only used where we have hard Cement or Clay to work. It requires from 10 to 12 H. P. to run the complete machine, and from 6 to 8 H. P. for the 18' one alone. I also manufacture a 6' machine about one-half the diameter of the others, and lighter in proportion, to be run by hand power, with small amount of water, and capacity of about two tons per hour. This can be easily moved from place to place.

For Testimonials and Particulars, Address : : **S. K. SNODGRASS, Denver, Colo. (The Windsor.)**

DEWEY, STRONG & CO., Patent Agents, 330 Market St., S. F., Cal.

100 POUNDS OF ORE SAMPLED IN 10 MINUTES.

Calkins' Umpire Ore Sampler.

An accurate, quick and absolutely impartial machine for sampling ore in quantities of from

one to one hundred pounds.

Easily operated and cleaned.

No danger of salting subsequent samples.

Makes the operation of sampling an

easy one; and all competent

assayers know that to obtain

an assay sample by hand

requires more trouble and

time than is necessary to re-

duce the resultant sample to

the pulp. Diagonally opposite portions are

taken each time; and assay samples are ob-

tained with this machine in less time and with

less trouble than by any other method.

DENVER, COLO., U. S. A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

A COOL ROOF==

P. & B. Ready Roofing is the right roofing for buildings located in hot climates. Its qualities make it a non-conductor of heat. Buildings roofed with P. & B. Ready Roofing are always cooler than those roofed with iron, tin, shingles or slate. The heat resisting properties of P. & B. Roofing have been put to a severe test on the extensive roof of the Kern County Land Co. in Bakersfield. This roof has a steep pitch and is at times subjected to a sun temperature of 150 degrees and leaves no signs of cracking or running. In fact, it is in as good condition as the day it was laid, while the interior is always cool. P. & B. Ready Roofing is invaluable for roofing packing houses, ice houses and cold storage plants.

SPADONE'S CONCENTRATOR BELTS. PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

AMERICAN EXPANSION PULLEY.

RUN

ANY CONCENTRATOR

with this pulley

and be surprised at improved results.

THE AMERICAN EXPANSION PULLEY CO., Denver, Colorado.

Fraser & Chalmers, CHICAGO, ILL., U. S. A.

The accompanying cut shows our Standard Steel Water Jacketed Blast Furnace of the Rectangular Type for Lead Ores.

We make also Copper Matting, and every description of approved smelting and roasting furnace plant.

Our Catalogue No. 3 gives particulars, and we will be glad to have you write us for estimates.

FRASER & CHALMERS,
CHICAGO, ILL.

TREAT YOUR ORES,
SAVE YOUR VALUES,
CONCENTRATE
AND : : :
AMALGAMATE

In substance at one operation
by the

Hooper & 
Pneumatic
&  System.

Floor Space, 3x6 Ft. Weight, 2250 Lbs.
Capacity, 10 to 50 Tons Daily.

WE USE NEITHER
WATER, CHEMICALS NOR QUICKSILVER.

Ores, etc., Treated:

Gold,	Copper,	Corundum,
Lead,	Chrome,	Antimony,
Zinc,	Nickel,	Cinnabar,
Mica,	Clays,	Black Sands,
Tin,	Garnet,	Any Sands,
Slags,	Graphite,	Mixed Ores,
Silver,	Fluor Spar,	Metallic Ores.

SAMPLE LOTS TREATED FREE.
WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cid., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

Is the only reliable method of treating mixed, slimy or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

All of our latest improvements are
embodied in this instrument and it is
the result of our 18 years' experience in
building balances.
Among the noteworthy features in
the make-up of this balance is the
improved adjusting device, herewith
shown.

The adjusting device will appeal to
the assayer as the simplest and most
convenient means of checking the
beam, and consists of a star wheel on a
framed arbor, mounted on the center
edge back of the beam.
By turning this wheel backward or
forward, it is moved along the arbor
and so adjusts the beam to equilib-
rium.

SOLE AGENTS.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore.
OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tail-
ings, and our record of re-sults—showing in almost every instance achievements on the large scale such
as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a
Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade prop- erties in the West owe their success entirely to these processes:
our experts, however, are constantly devising improvements, the latest being a method of overcoming
the difficulties which have hitherto prevented the successful handling of ores containing copper and
also a method for the profitable handling of silver ores by cyanide.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced
first-class agency. We have able and trustworthy associates and agents in Washington and the capi-
tal cities of the principal nations of the world. In connection with our scientific and Patent Law Li-
brary, and record of original cases in our office, we have other advantages far beyond those which can
be offered home inventors by other agencies. The information accumulated through long and careful
practice before the Office, and the frequent examination of patents already granted, for the purpose of
determining the patentability of inventions brought before us, enables us to give advice which will
save inventors the expense of applying for patents upon inventions which are not new. Circulars and
advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market
St., San Francisco, Cal.

PORTLAND
OREGON

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.: "We have used Leviathan Belting for four years, up to 34 inch by 8 ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

MAIN BELTING COMPANY,
1235-41 Carpenter Street, Philadelphia.

DRY PLACER MACHINES.**THE PNEUMATIC PROSPECTOR.**

Size 6x11x14 in. Weight only 19 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quicksilver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.

Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SEND FOR DESCRIPTIVE CIRCULAR.

SULPHURIC ACID

MANUFACTURED BY
THE WESTERN CHEMICAL CO
DENVER, COLO.

For Chlorination, Refining and other processes. Also Muriatic and Nitric Acids, Blue Vitriol, Copperas Commercial and C. P. Our chemically pure Acids and Ammonia are guaranteed perfect.

The Lunkenhimer ("99" MODEL) Standard Injector.

UNIVERSALLY APPLICABLE.

This machine is warranted to show in actual service results hitherto unattainable with any other make of injector on the market. With feed water at 75° F. LIFT 6 FEET, it will work WITHOUT ADJUSTMENT OF STEAM OR WATER AT ALL PRESSURES FROM 40 TO 250 LBS. AND HIGHER, AND THE CAPACITY CAN BE GRADED OVER 50% AT ANY POINT IN THAT range of work. Note carefully, ALL CONDITIONS ARE MENTIONED IN THIS STATEMENT. The construction is simple and free from all complicated mechanism. All parts are easily accessible and tubes are very durable. In grading the capacity, the steam supply is cut down in proportion to the water, hence the discharge is cool and scale is not so liable to form.

It is thoroughly reliable and can be started promptly under the most extreme conditions, and UNLIKE many others its efficiency is not confined to any particular season of the year. The capacity increases with the pressure. A trial is solicited and satisfaction guaranteed. Write for Catalogue of superior brass and iron Steam Specialties.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

THE BRETHERTON HOT BLAST.

APPARATUS FOR PYRITIC SMELTING. It saves fuel, increases capacity of furnace, improves character of work, does not require a hot top causing volatilization like other inventions, furnishes pure air heated without cost, can be attached to furnaces already in use, is an all around money saver, built and used by practical, successful metallurgists. Write for particulars to

ASSESSMENT NOTICES.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of March, 1901, an assessment (No. 10) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of April, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
N. F. REMINGTON, Secretary.
Office—112 Main street, San Francisco, California.

SOUTHLIER GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Spanish Dry Diggins Mining District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of March, 1901, an assessment (No. 1) of two cents per share was levied upon all the issued or subscribed for capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 402 Front street, Room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. L. DANIELS, Secretary.
Office—402 Front street, Room 8, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California; location of works, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of March, 1901, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 823 Parrott building, 825 Market St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. C. ANTHONY, Secretary.
Office—Room 823 Parrott building, 825 to 855 Market St., San Francisco, California.

DELINQUENT SALE NOTICE.

And in accordance with law, and an order from the Board of Directors, made on the 15th day of February, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at 234 Sutter street, San Francisco, California, on MONDAY, the 8th day of April, 1901, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. GOLDSMITH, Secretary.
Office—236 Sutter street, San Francisco, California.

A BORE HOLE

is the cheapest, quickest, most direct, and most effective way to test lands for minerals, oil, gas, salt, sulphur, borax, water, etc.

THE STAR DRILLING MACHINES

excel for these uses. They will drill a hole through anything to any depth from 250 to 2500 feet. The only machines made that are absolutely without annoying springs. They are simple, powerful and efficient. Easy to handle at work or on the road. Used in every State and Territory and in many foreign countries.

We also make full line of drill tool-bits, reamers, sand pumps, spuds, etc., etc. Write for illustrated free catalogue.

Star Drilling Machine Co.,
Akron, Ohio.

POINTS OF EXCELLENCE OF OUR NEW JACK-HEAD PLUNGER PUMP.

Pumps sand and grit without injury to cylinder.

Seldom requires packing and is easily re-packed.

Forces water on the down stroke so does not require balanced bob.

Water column and pump rod can be made to perfectly balance.

Each pump is provided with an automatic air valve which relieves pump of air taken in when suction gets out of water.

Combines strength with lightness.

We make a specialty of pumps and would be pleased to forward to you our catalogue.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Old Channel Placers.

The placer discoveries made occasionally in hitherto unknown "old river channels" are reminders that possibilities of profitable drift and hydraulic mining still remain to be discovered and exploited in the California mountains. The recent strike in Tuolumne county, Cal., the finding of a channel in the Eureka Consolidated and another in the Big Dipper, in Placer county, Cal., and the discovery of the old Trinity county channel at Oregon Gulch, all within the past six months, are examples of the conditions referred to.

The exploration for these undiscovered channel deposits has become more certain and safe in its methods during recent years. The relation of the different channels to each other and the conditions that have determined the occurrence and distribution of gold in them are better understood now than even ten years ago. The practical application of this added knowledge permits some reconstruction of plans of old channel lines, connecting remnants and restoring original old lines, enabling synthetic reasoning to be applied to determine the most probable commercial possibilities of a particular channel considered.

The "old channels" are not all of the same geological age. There are several successive systems of them, occupying different lines within drainage basin limits which would seem to have suffered less relative change than the stream-cutting lines. Ross E. Browne very clearly stated the facts of the successive systems and suggested the special topographic changes which produced them in his contribution to the California State Mineralogist Report of 1890. Something additional to his admirable descriptive data is suggested here that may aid in solving in advance the practical commercial questions that the miner must answer.

The gold found in any of the channels had its first situs in a lode matrix of hard rock. The oldest of the "old channels" disintegrated and wore down the rock surface of its drainage basin and released gold from its original matrix. This gold, once free from its attached rock, accumulated in the channel bed of the cutting stream. Practically it ceased to move down stream when once free, but remained very close to the point where freed. Fine scale particles did move, just as their downstream movement is noted now, but the coarser gold remained in place, dropping down only as the rock was cut out from underneath it. Ultimately this stream cutting in depth ceased as it reached a level where, grade disappearing, the velocity diminished and would no longer cut or carry the rocks. Filling up with the products of erosion from above, the water flow raising on the accumulation ultimately regained a cutting and carrying gradient, which, working through the accumu-

lations, restored the rock bed again, or, working on the side of the accumulations, cut more rock in place and widened the first cut bed, the process repeating itself till a comparatively small stream made a wide valley out of an initial canyon cut. Consideration of the grade conditions will deduce the conclusion that the gold deposited and accumulated in the first cut line would not move out of that line and become spread over the widened bed of the successive cuts, and the further conclusion that any gold found in the added width must come from the direct erosion of

that line, and its relative mass to the mass in the first cut line would be as the ratio of the respective rock masses eroded. Again, consideration of the conditions of the two erosions will deduce the conclusion that the mass of the primary line of erosion is many times the mass of any one of the secondary lines, or all of them combined. Therefore the phenomenon of the "pay lead," a more or less relatively narrow line in a wide channel bed, carrying the mass of the gold, is the line of the first cut channel, and in its width fairly measures the width of the stream

that originally flowed. It is notable that the line of this lead is relatively more direct than the boundary lines of the full bed. The Hidden Treasure mine, Placer county, Cal., in its white quartz channel is an excellent example of an original "old river," the pay lead being only a fraction of the full bed width. This, however, is not the point of these observations.

Consider, now, the second "old channel." In its case, the old stream bed, instead of gradually building itself up first, was suddenly filled up by eruptive floods of volcanics to great depths, so that when a new line of drainage began to form it was at greater distances, horizontally and vertically, than such secondary cuts as are already described. It was the same kind of phenomenon, but in more extreme degree. There are conclusive reasons for believing the floods of volcanics were accomplished by regional tilting uplifts increasing the new stream grades. These eventually cut down channel beds to somewhere near the first cut planes, ordinarily going somewhat deeper. Considering, again, the physical conditions, it is fairly deductive that these new channel beds would accumulate gold, compared with the first channels, in the ratio of the masses of their respective bedrock cuts. Except under the exceptional conditions of a diversion into a line at a very considerable distance and of substantially equal depth of cut into lode-bearing bedrocks, the gold accumulated would

certainly be less. As determining the relative time interval, it is observable that these second channels rarely show the "pay leads" that are characteristic of the first system of channels. The "pay lead" in these second channels, if there be a "pay lead" derived from gold concentration from primary erosion, is co-extensive with the full width of the channel cut, which here again is in a general way about the same width as the corresponding "pay lead" of the first channel. Where the second channel cuts in the line of or across the "pay lead" of a first channel, it receives its gold and adds it to its own direct accumulation, making a local enrichment that, misunderstood, has led many a miner to his financial destruction.

Third and fourth, and, in fact, all intermediate systems of channels till the existing stream drainage

L. E. Aubury, State Mineralogist of California.

California's State Mineralogist.

Herewith appears the portrait of L. E. Aubury, the new State Mineralogist of California, appointed by the Governor on the 5th inst., as stated in last week's issue. Mr. Aubury is the second vice-president of the California State Miners' Association, a Native Son of the Golden West. He proposes to administer the affairs of the State Mining Bureau in a business-like manner. He was born in Placer county, Cal., in 1862, and has had considerable practical experience in mining and metallurgical work in various parts of the Pacific coast. At the time of his appointment he was developing some gold quartz properties in Mariposa county, Cal., and acting as consulting engineer for three mining companies operating in California and Arizona.

took form, were subject to similar limitations and conditions with the second system, the genesis of which is here described in detail. Generally they would cut successively less masses of the primary lode-bearing bedrock, and, generally, less successively of the preceding channels. They are thus less notable as gold producers to mining; indeed, it is safely to be concluded that, if an old channel is not gold-bearing, it is neither of the first or second system.

The existing stream lines have cut so far through the old beds that the masses of the lode-bearing rocks cut bear a more appreciable ratio to the corresponding masses cut by the first channel system. Still, it is inferable that they are less. The beds are not yet down to a corresponding base plane of erosion. Like the first system, however, and unlike the intermediate systems—except in some uncommon instances—the existing stream channels had a fairly uniform distribution of gold lineally. The exceptionally large accumulations in certain sections were places where the first and second systems had been cut out.

In a general way, certain observable facts with the preceding suggestions are possible of reasoning to and from. The first channel system is characterized by "pay leads" occupying a fraction of total channel bed width and a fair lineal uniformity of gold accumulation. The last (existing) system has no special development of pay leads and less uniformity of lineal accumulation of gold; the intermediate systems lack characteristic pay leads, and are uncertain as to gold accumulation lineally; the miners would say the pay is spotted.

There are still many unexplored fragmentary remnants of the first and second systems of channels that have prospective commercial value. The suggestions made may be of some assistance in establishing identity and probable extent of minable gold content.

THE idea of the U. S. Government to establish a mint at Manila, P. I., U. S. A., is of importance to Western miners. Such action would create a clearing house for American silver in the Orient and would stimulate the demand among the 600,000,000 people who demand and hoard silver. It would be of benefit to miners wherever silver is susceptible of production, would transfer the control of the silver to San Francisco and would lead to further and industrial developments that naturally go progress and expansion.

Silver in the Orient.

The commercial position of the United States in the Orient incident to the possession of the Philippines, should ensure to the country, and particularly to the Pacific mining section of it, the control of the world's greatest silver consuming market—the Chinese Empire. A step in the right direction toward this control is the establishment of a Manila branch of the United States Mint. A second step, and one certain to be made before long, will be the establishment of United States banking facilities in Manila and Shanghai and more or less in other Chinese cities. After these two steps, the rest will follow naturally. From the existence of causes or influences that would seem to have no reasonable business excuse for existence, steamship freight charges are less on silver shipped from, say, Germany, via the Suez Canal and around the south of Asia to Shanghai, a voyage of over thirty-five days, than they are from San Francisco across the Pacific to the same place, a voyage of not more than twenty days. The marine insurance of the silver from Europe to Shanghai, the longer time and proportionately greater risk, is more than from San Francisco to Shanghai, the shorter time and relatively less risk. The interest loss for the elapsed time between shipment and delivery, which must be borne by the seller, would certainly be against the most distant supply point. Exchange, always a factor in international business, should now be favorable to the Pacific coast, or, at least, not so greatly to its disadvantage as formerly.

With the branch mint and our banking facilities at Manila, it would seem that a depot for our silver product could be established there, supplied directly from the silver-producing Pacific coast States. It is assumed that the advantage of freight and insurance charges could be secured to the shipment of silver across the Pacific, to which it logically belongs.

Silver is the banking money metal of the Chinese. They understand, at least the commercial classes do, the changes of relative value measured in gold, still they use it to hoard their surplus wealth accumulation and will doubtless continue to for many years to come. They understand and are able to determine accurately the fineness of silver. In transactions among themselves they discount any debasement of fineness of the pure metal, so that only fine silver, 999 fine, should be marketed to them. The large bars made by our refineries they cannot use in transactions among themselves. They remelt these and cast the silver into rough cup-shaped forms weighing from one to three pounds, and these pass from hand to hand by weight. So far as known there is no prejudice among them as to the shape, so that our refineries could cast from the first melting of the refined silver "bars" and "kings" of the small weights noted. These saving the cost and loss of remelting by the Chinese would have some market value in excess of such large commercial bars as are now made.

At the present time a very considerable proportion of the silver taken by the Chinese passes through Hamburg, Germany. Manila is so much nearer a supply base for the metal that it should supply the market. The Chinese are close buyers. In their own exchanges the price of silver changes from day to day, and the demand between the seasons, and they speculate in it just as our own people do in wheat and corn. They could hardly fail to avail themselves of the advantage of a silver supply fewer days distant than the alternative supply is weeks distant.

COMPLAINT is made by a producer of a piece of mining machinery that he is unappreciated; that while he has a manifestly good article, something of value to miners, yet he is passed over and there is no demand for his production. There is always something pathetic about so old and so common a story. Probably the business office of every mining journal in the country is visited weekly by some one who has invented or is making some kind of mining appliance that he thinks needs only to be seen to be prized, and who wonders why the buying public does not eagerly reach for it. The men of whom complainant is a type either do not know or have forgotten that inventing or manufacturing an article and creating a demand for it are two entirely separate and distinct things. Many men manage both successfully; many more do

not—they can not, and their chief need is a business manager. There is many a clever device, many a saleable article, many a really meritorious production, that would make a financial success were its merits made known and a demand properly created for it, but in these bustling days of competition few things can be sold before a demand is created for them, and unless possible and probable users are informed of the merits of a device or appliance it will remain unsold.

The Smelting Combination.

The American Smelting & Refining Co. have increased their capital stock to \$100,000,000 and have bought or amalgamated with the Guggenheims. The suit brought to restrain the purchase was withdrawn, the objections of stockholders having been adjusted.

It is early to determine the commercial effect on mining of the practically total elimination of the custom smelting competition. There are possible some economies that will reduce smelting costs, and treatment charges may be diminished, lowering the commercial limit of ore value that can be mined and increasing the quantity of the output. But with these possible advantages that the smelting monopoly may share with the mining will come a restriction of the independence of the miner, and the forced assumption by him of all the risks incident to mining. With competition between smelters, the miner could share with them the risk of the market for his product of the metals other than gold, which is always worth \$20.67 an ounce. The consolidation, however, will hardly assume any of this clearly avoidable risk simply because it will not have to. On the other hand, there is a certainty of dealings with the single buyer that will be distinctly to the advantage of the larger and cheaper producers of ores. The business for them will take on a more commercial character. A secondary result can not fail to be a consolidation of the mines supplying the ores. On the mine owners the combination is the beginning of a pressure that will cumulate and in the end be irresistible. It is the logical end, that would seem to be anticipated by what is now occurring.

THE hearing by the California Railroad Commission of the appeal of the oil producers to have lower freight rates has been postponed till some time in May to permit the elaboration of the question by the attorneys, which means, if the lesson of similar contests in California has any pertinence, that there is practically an indefinite postponement of the possibility of reduction through the means provided by law. Why this should be so is not clear; the question deals with practical every-day business and seems remote from the abstractions of the law. Oil wells do not live forever, and people who sink them must market their product. Postponement has the effect of making the financial sufferers of to-day work for producers of to-morrow without benefit to themselves. After all, the railroads help those who first show ability to help themselves. Suppose that some of the money that is going steadily into vertical holes in the ground be put into a horizontal hole on the surface—into a pipe line to the open sea. There are no physical obstacles that are insuperable, and the combined capital now in the industry should be equal to the financing of it.

It is never safe to condemn a mining prospect without fair exploring and exploitation. And nothing but intelligent development work will determine whether or not the prospect can be made into a mine. The history of every mining region proves this. Take the Territory of Arizona. The great Congress mine, the deepest in Arizona, was accounted a "wildcat" at the depth of 150 feet; at the depth of 800 feet it was a bonanza and held at \$3,000,000. The Fortuna was worth \$100,000 at a depth of 150 feet, and worth \$2,000,000 at a depth of 600 feet. At a depth of 100 feet the King of Arizona sold for \$30,000; when 500 feet deep it was worth \$1,000,000. The Crowned King mine was not considered worth being got out of debt when the workings were 165 feet deep; at a depth of 400 feet its value was \$1,000,000. The Pearce mine was sold for \$275,000 when down 100 feet; since then \$2,000,000 was refused for it. These are but a few in Arizona. Every other great producing section can tell a similar story.

Concentrates.

A "STUDDLE" is a corner post in shaft timbering.

UNOXIDIZED tellurium ores require a dead roast before cyaniding.

COPPER furnishes the best and biggest present metal mining dividends in this country.

THE limit of efficiency in a stamp, so far as weight goes, is believed to be below 1000 pounds.

A MINERS' INCH in California is now legally determined to be a flow of $1\frac{1}{2}$ cubic feet per minute.

A MIXTURE of lead 75 parts, antimony 16.7, bismuth 8.3, will give an alloy that expands when cooling.

THE value of an expert's opinion is sometimes to be measured by the instructions given him to report.

THE evaporation of gasoline at high altitudes over 5000 feet is such that it is desirable to use a heavier oil in explosion engines.

THE character of the ore must determine whether wet or dry crushing shall be employed. In case of direct cyaniding, modern practice tends to dry crushing.

THE power of a rock drill is in direct proportion to the area and weight of its piston. Its efficiency depends, largely, upon its adaptability to the work that it is expected to do.

THESE little paragraphs every week are largely answers to a variety of questions, made as brief as accuracy will admit, the questions themselves omitted for want of space.

A "FAULT," as the word is used in geology, is applied to describe a line of fracture or break of the rock formation where one side of the break slips and becomes displaced, relative to the other.

Probably the best work on mine timbering of recent years is the treatise by W. A. Storms, and published some years ago as a bulletin by the California State Mining Bureau. It is now out of print.

THE spodumene shipped in carload lots from the Woods mine, near Keystone, South Dakota, is a silicate of alumina and lithia, and, when pure, carries about 10% aluminum and 2% of the metal lithium.

WHEN air is used to drive machinery of any kind, the mechanism so employed is called a compressor; when the air is used for smelters, furnaces, ventilators, etc., the compressor is called a blowing engine.

SODA ASH for boiler incrustation may be pumped in with the feed water, in the proportion of about one-fourth pound per horse power of the engine, and the boiler blown out and cleaned out next day.

IT is reported that the Carnegie Steel Works have bought and experimented with a patent for coating steel with aluminum, much as iron is coated with zinc. There is nothing of the kind on the market yet, however.

A "STULL" is a stick of timber reaching usually from wall to wall, for supporting the hanging wall, or placed nearly horizontal to help form floors of lagging on which ore or waste may be broken down from overhead.

CYANIDE, when bought in large lots, is obtained at much closer figures than those on small consignments. The Con. Mercur G. M. Co., Mercur, Utah, buys 400,000 pounds at one time, and hence, gets the benefit of wholesale rates.

SHIPMENTS of lead ore in the shape of sulphate are rarely received at the Selby Smelting & Lead Co.'s Works, Selby, Cal. They usually get lead ores in the shape of either sulphide (galena) or carbonate, mostly the former.

IT is doubtful if there is any process of reducing ore to a fine state of division cheaper than wet crushing with stamps; or any method of recovery cheaper than plate amalgamation, where the ore is readily susceptible to such treatment.

THE Supreme Court of California has decided that labor performed in breaking down and tearing away from the face of a drift quartz and other substances in a mine creates a rightful lien for labor in the "construction, alteration and repair of a mine."

AN Arizona law has made the cubic foot of water the legal measure in that territory. Where miner's inches have been used, 100 inches are to be counted as the equivalent of $2\frac{1}{2}$ cubic feet a second. This is identical with the measures provided by recent laws in California and Montana.

TO AVOID the claim jumper, it is well to conform to the strict legal requirements of staking and marking boundaries. Before everybody was locating claims trouble from this source was infrequent, but the newcomers look closely for technical defects and take advantage of them.

THREE $2\frac{1}{2}$ -inch rock drills, at sixty pounds ocean level, would need a compressor with free-air capacity of 133 cubic feet; at eighty pounds, ocean level, 168 cubic feet per minute. At 5000 feet altitude, seventy pounds pressure, a drill would require free-air capacity of 177 cubic feet per minute.

MORTARS for stamp mills are frequently provided with steel linings for ends and sides and steel false bottom for dies to rest on, thus reducing wear on inside of mortar castings. In double discharge mortars the pulp discharged through the back screen flows toward the center at the back of the mortar, thence conveyed through

openings in base of mortar, joining the pulp from the front screen. In dry crushing all mortars are double discharge.

TUNGSTEN minerals find their principal utility in the preparation of ferro-tungsten, which is used in making tungsten steel. The steel manufacturers are the buyers of the ores; but market prices are variable, the use being new. The Illinois Steel Co. or the Bethlehem Steel Co. will quote prices on application.

THE failure to record a work notice within the period provided by law does not work a forfeiture of the claim. The record is prima facie evidence of the fact that the work was done, but if not recorded and the work was actually done the claimant may produce proof in a trial court that he did in fact perform the work and prevent a forfeiture.

THE barometric reading in inches multiplied by .4908 = pressure per square inch, from which is determined the approximate altitude. For instance, if the barometer indicates 25.4, the pressure per square inch is 12.47, showing, approximately, an altitude of 4620 feet. The barometer standing 21 inches indicates: pressure, 10.31; altitude, 9900 feet.

A JUDGMENT against a corporation which, by the laws of the State in which it is rendered, is binding on the stockholders must be given by a court of another State the same conclusive effect against a stockholder who is sued therein, and the only defense which he can make against it is that which he can make in the courts of the State in which it is rendered.

THE Montana Supreme Court has decided that miners claiming extralateral rights must bear the burden of proof. The decision holds that the owner of a claim has a prima facie right to the whole of it; that a person entering from an adjoining claim is a prima facie trespasser, and, if he claims rights because following the vein from an adjoining claim, the burden of proof is on him to justify his trespass.

THE price of gold is not going down, though a Harvard professor is quoted as predicting an enormous increase in the production from dredging operation of placers. The mechanical handling of gold-bearing sands by dredging costs a sum fairly close to the value of the gold obtained. There is no such general distribution of gold values in the sands and gravels available for dredger exploitation as the professor is reported as claiming.

IN Montana corporations issuing capital stock must annually file a report between Aug. 10th and Sept. 21st, stating amount of capital stock proportion paid in and amount of existing indebtedness. Such report must be signed by the president and a majority of the trustees, and published in a newspaper nearest the principal Montana office of the corporation. Failure to comply with the foregoing renders the directors liable for all the debts of the corporation.

THE diamond-bearing formation at Kimberly is a serpentine—the filling of an old volcanic crater. Serpentine is abundant in Sierra Nevada mountains, Cal., and it is possible that the diamonds found in placer mining in Butte and El Dorado counties may have come from some of these serpentines. While mining for placer gold no one was specially looking for diamonds, the finds being incidental. Possibly, if prospecting was done systematically, the source of the supply might be found.

FULLER'S EARTH, such as is found near Bakersfield, Cal., can be used for refining mineral oils. The ordinary way is to dry the earth thoroughly, then grind to 60-mesh and fill it into long cylinders through which the crude black oil is allowed to percolate very slowly. The oil that first comes out is clear as water and much thinner than that which follows. When the color of the exuding oil reaches a certain maximum shade the process is stopped, and the cylinder refilled with fresh earth, when the percolation is resumed.

THERE are cinnabar deposits in New South Wales and some other Australasian colonies, but their development has been slight and so far has not proved profitable. Quicksilver is mined in a small way at Savonas, B. C., and at Terlingua, Texas. The quicksilver industry in California is on the increase, there being new deposits recently found in various parts of the State. The present annual production of the world is about 4400 tons, of which about 1800 tons are produced in Spain, 1300 in California, 800 in Austria, 500 in Russia.

THE action of vapors in volcanic districts in forming ore deposits can not probably be separated from that of hot solutions. In most cases both are in operation at the same time. On the borders of molten rock bodies such fumarole action is active in metamorphosing the cold country rock. Often, without completely destroying the identity of the country, ore materials are deposited in the interstices and cracks. In this way considerable ore accumulations are often made along the contact of the molten body of rock and the country.

FOR the manufacture of artificial ice there are two general methods, the can and the plate systems. In making ice by the can system, galvanized iron cans containing the water to be frozen are immersed in a brine bath maintained at a low temperature by submerged cold ammonia expansion coils. The water is frozen inwardly, and any air or impurities existing in the water are, of necessity, frozen into the center or core of the ice block. To so make clear ice, it is essential to use water that has been carefully filtered and purified. In the plate ice-making process the plant submerges the cooling or freezing coils directly in the fresh water to be frozen

and allows the ice to form on the outside of these coils, from which it is then cut. The water is frozen outwardly, excluding the air and impurities into the residual unfrozen water.

GOLD-SODIUM CHLORIDE is used mostly in photography. The best is supposed to contain 30% metallic gold, but is often adulterated. It sells at from \$7 to \$15 per ounce. The amount of gold therein can be determined as follows: Transfer the contents of the vial into a 250 c. c. evaporating dish by means of 100 c. c. of a 1% solution of pure sulphuric acid. In this mixture dissolve two grains pure oxalic acid, then place the whole on a steam bath for two hours, or until all the gold is reduced to the metallic state. Decant the clear liquid as closely as possible, wash the gold with distilled water, dry, ignite and weigh.

LEAD mined in Canada may be shipped to the United States, undergo any process of manufacture and, afterwards, by way of Great Britain, be returned into Canada at a reduced rate of duty. The bulk of the Canadian and Mexican lead smelted in the United States is thus reshipped to Great Britain. Such lead passes through the United States in bond, encounters no duty in Great Britain and commands there a price which is usually less than $1\frac{1}{2}$ cents per pound lower than the New York price. Under the privilege of free re-entry the smelters at Trail and Nelson, B. C., return a portion of their lead output into Canada, after having it desilverized in the United States.

PLATINUM in Russia is found under conditions that connect it with serpentine as the original rock matrix. In California it is not so localized. Serpentine belts are prominent in the Sierras, but platinum is rarely found there, and prospecting for it is not justified. The heavy mineral that was hard to pan away that the old miners tell about was undoubtedly something else. In the Siskiyou and Trinity mountains the serpentine would seem to have been more or less productive of platinum, and while perhaps not worth the risk of special prospecting for, the heavy minerals remaining with the placer gold in the last panning will generally pay for saving for the platinum they contain.

THERE is a difference between "conditions" and "indications" in determining the question of boring for petroleum in any particular tract of land. The "conditions" relate to the nature of the rocks, their stratigraphy, dip, the position of folds and such structural phenomena. The "indications" are what the surface shows, such as escaping gases, salt and mud springs, whitened shales, bitumens, seeping oil or asphaltum. Both conditions and indications should be studied carefully. Neither is conclusive in determining the commercial probabilities, which are what is wanted before one bores for oil. It frequently happens that the "indications" are all right and the "conditions" all wrong, or it may be the reverse. In neither case is commercial success probable.

IT may be considered as demonstrated that the earth would be fluid at a certain depth but for the pressure of the superincumbent mass which prevents it expanding to the volume which fluid requires and presses it into a solid. The relief of pressure allows that to expand and become liquid, and it is already above the temperature of fusion, but is unable to fuse because of pressure. When that pressure is removed it expands into fusion. The interior of the earth is mostly a solid. Up to within 30 or 40 miles of the earth is solid. The center of the earth is solid with small reservoirs, a certain amount of liquid matter in local pools, of vast extent in some cases, deriving the heat from the initial heat of the earth, the residual heat from the original heated condition of the earth. This may constitute the explanation of a volcano.

IN the MacArthur-Forrest cyanide method cyanide solution is used without any other chemically active agent as a lixiviant, and filiform zinc as a precipitant. In the Siemens-Halske process the cyanide solution is used as a lixiviant, the gold and silver being electrically precipitated on lead cathodes. The Pelatan-Clerici process provides for fine wet crushing of the ore, with little water, making a thick pulp, subsequently agitated in vats with the addition of solid cyanide, so proportioned as to result eventually in a weak solution. After sufficient agitation an electric current is turned on, a mercury bath at the bottom of the vat acting as a cathode, and iron plates in different parts of the vat serving as anodes, with a view to having the coarse gold not dissolved, as well as the gold in solution, received in the form of amalgam.

REVERBERATORY SMELTING of lead ore consists of a combined roasting and reaction process, in which the two operations are repeated one after the other. In hearth smelting, on the contrary, these two operations, which also constitute the process, are not consecutive, but simultaneous, roasting and reduction going on at the same time. In the reverberatory furnace lead is reduced from the ore by the interaction of the unaltered galena—that is, the sulphide—with the sulphate and oxide; in the hearth furnace there is additional reduction from the lead oxide by carbon. The reverberatory furnace is worked without a blast, the hearth with one. In the latter furnace the ore and fuel do not rest on a solid bed, but on a bath of molten lead. The charge in the hearth furnace is never fused; but at intervals the blast is stopped, a portion of the charge removed, the poor slag separated from it, and, after cooling and an admixture of lime to stiffen it, the charge portion is returned to the furnace.

Power Required by Stamps.

TO THE EDITOR:—I have only just received a copy of your issue of February 23rd, containing Mr. A. W. Warwick's excellent paper on the power required by stamp mills. Mr. Warwick discusses in his paper certain formulas that I had published some years ago in my "Handbook of Gold Milling," and although a considerable interval must necessarily elapse between the date of publication of his paper and the arrival of the present comments thereon, I hope that it will not be too long to prevent your inserting this letter.

Mr. Warwick bases his comments upon the statement that the indicated power required to drive a certain mill was 1.785 H. P. per stamp, while according to my formula it should only have been 1.393 H. P. Now, in the first place, my formula is only intended to determine the power absorbed by a well-designed stamp mill. If the mill in question were badly designed or badly constructed, it might use far more power than the figure stated by Mr. Warwick, without, therefore, impugning the correctness of my formula. Thus in one case I found that a light (700-pound) mill was consuming over 2½ H. P. per head, of which only about 1½ H. P. did useful work, the remainder simply straining and racking the mill structure. I should like, however, to assume that Mr. Warwick's mill is a fairly well designed one, and is not consuming much over the theoretical amount of power as determined by my formula. Even in this case the discrepancy in the figures noted by Mr. Warwick admits of a very simple explanation, the very simplicity of which has probably caused that gentleman to overlook it. My formula determines the amount of effective power that has to be applied in the form of torque to the cam shaft. Mr. Warwick has indicated his mill engine, and, therefore, has simply determined the amount of work done by the steam upon the piston of his engine. In other words, he has taken indicated horse power as though it were brake horse power, and has, moreover, forgotten to allow for the power absorbed by the belting that transmits the power from the engine to the cam shaft. Without knowing the class of engine employed by Mr. Warwick, it is impossible to say how much greater the indicated horse power would be than the effective, the latter ranging from less than 60% to over 90% of the former. If his engine is an ordinary high pressure horizontal engine, such as is used for driving ordinary mills of small size (say under twenty stamps), the efficiency will probably not exceed 80% or 85%, so that an indicated horse power of 1.785 would be equal to an effective horse power of only about 1.4 to 1.5, and when further the power absorbed by the belting is taken into account it will be obvious that Mr. Warwick's figures appear to confirm very fairly the correctness of my formula.

To account for the supposed discrepancy between his observations and my formula, Mr. Warwick calculates what he calls an "inertia factor," that is to say that he calculates in the first place the height to which the stamp would rise owing to its upward velocity when the tappet leaves the cam, and considering (as is actually the case) that the work of generating this velocity has to be performed by the cam, he expresses this additional work in the form of a hypothetical addition to the weight of the stamp. He is quite right in considering that the work thus done in lifting the tappet above the point where the toe of the cam leaves it has to enter into the calculation. He prefers to state this in the form of an increase in weight, whereas I prefer to state it in the form of an increase in the height of lift, which it really is. I quite admit, however, that his method would give equally correct results if correctly applied. Here, however, Mr. Warwick has gone wrong, because he has calculated the height to which the stamp would be lifted if there were no friction, and has then proceeded to calculate the friction absorbed during the whole of his hypothetical lift, taking the proper frictional coefficient. He, therefore, greatly overestimates the correction to be applied.

On the other hand, careful examination of my formula will show that I have not neglected the question of the work done by the cam in lifting the tappet above the toe of the cam, seeing that I have taken for the height of lift in my formula the height to which a true involute would lift the tappet, although the toe of the cam is a modified involute, giving a lift of ¼" to ⅜" less than the true involute curve (page 204, "Handbook of Gold Milling," second edition). In other words, I add about ¼" to ⅜" to the theoretical height of lift as taken from the cam drawings, and I find that, allowing for the depth of the bed of quartz on the die, this gives a figure very closely approximating to the actual facts.

Mr. Warwick considers that the formula for the friction in the guides as given by me is too small, and that it ought to be doubled because there are two guides. It is, however, perfectly well known that friction is independent of the area of the rubbing surfaces in contact, and depends only on the amount of motion. The amount of power lost by friction is, therefore, quite independent of the number or depth of the guides, and, other things being equal, depends only upon the actual lift of the stamp.

I have made numerous tests and have indicated mills driven by various types of motors—steam,

hydraulic and electric. In each case the same difficulty occurs. It is easy to determine how much force is applied to the motor, but very difficult to determine how much is given out. The best plan, practically, though not quite exact, is to run the mill at a given speed and to then indicate the motor, throw off the belt, and run the motor alone at the same speed as it was running at in the first test, and again indicate it. The difference is the power used in driving the mill plus that lost in the transmission. If the transmission is by belting, the loss can be calculated with sufficient accuracy. If Mr. Warwick will do this for the case in question, I expect he will find that the power thus absorbed by his engine running unloaded will be somewhere about 0.3 H. P. per stamp.

Furthermore, in calculations of this kind I always determine the lift of the stamp by actual experiment. I slip a sheet of paper round the stamp stem above the top guide, and keep it in place by means of a couple of india rubber bands, and then hold a pencil firmly against the top guide so that its point touches the paper on the stamp stem. On taking off the paper the height of lift (and incidentally, also, the amount of rotation of the stamp) can be directly measured on the paper. With a little practice it is easy to do this while the mill is running.

I hope that these notes may prove of interest to some of your readers, and that I have made clear how the power really absorbed by a stamp mill can be measured. The essential point is to bear in mind that no formula can do more than determine the effective power absorbed, and that this power is always less—and sometimes a great deal less—than the indicated power of the motor. HENRY LOUIS.

Newcastle-upon-Tyne, England, March 16, 1901.

Genesis of the Diamond.

The dry diggings of the Kimberley district, in South Africa, afford the unique locality in which the diamond has thus far been found in its original home, and all our knowledge of the genesis of the mineral has been derived from study of this locality. The mines are located in "pans," in which is found the "blue ground" now recognized as the disintegrated matrix of the diamond. These "pans" are known to be the "pipes" or "necks" of former volcanoes, now deeply dissected by the forces of the atmosphere—in fact, worn down, if not to their roots, at least to their stumps. These remnants of the "pipes" through which the lava reached the surface are surrounded in part by a black shale containing a large percentage of carbon, and this is believed to be the material out of which the diamonds have been formed. What appear to be modified fragments of the black shale enclosed within the "pipes" afford evidence that portions of the shale have been broken from the parent beds by the force of the ascending current of lava—a common enough accompaniment to volcanic action—and have been profoundly altered by the high temperature and the extreme hydrostatic pressure under which the mass must have been held. The most important feature of this alteration has been the recrystallization of the carbon of the shale into diamond.

This apparent explanation of the genesis of the diamond finds strong support in the experiments of Moissan, who obtained artificial diamonds by dissolving carbon in molten iron and immersing the mass in cold water until firm surface crust has formed. The "chilled" mass was then removed, to allow its still molten core to solidify slowly. This it does with the development of enormous pressures, because the natural expansion of the iron on passing into the solid condition is resisted by the strong shell of "chilled" metal. The isolation of the diamond was then accomplished by dissolving the iron in acid.

Taxation of Arizona Mines.

The late Arizona Legislature placed in the new code provisions relating to the manner of making assessments that will, it is said, double the present assessment roll of the Territory, by increasing the assessments of mines. By the Act the final power to equalize assessments rests with the supervisors of each county, and the taxes on the assessment so equalized must be paid before an appeal to the courts to modify the assessment can be taken. Jury trial is not allowed, but the court shall hear evidence touching the actual cash value of the property assessed and is expressly prohibited from reducing the valuation of any property below the fair cash value of the property, or what the property would sell at for cash.

It is said that the law took its present shape as the result of a fight in the Legislature to divide Yavapai county in the interest of Jerome. In retaliation, the scheme is to assess the United Verde mine at \$10,000,000, on which the taxes must be paid before Senator Clark's company can go into court to prove, if it can, that the mine is not worth that sum. The present assessment is said to be about half a million, mainly on the machinery and equipment.

In Sardinia is now being treated slag remaining from mining operations there in the fourteenth century. At Villa-Massargia it yields 14% lead, 0.007% silver.

Notes on Tepic, Mexico.

TO THE EDITOR:—It would be difficult to find an area in Mexico so little known as to mineral deposits as some portions of the northwest United States. The Spaniards are pioneer miners, and the evidences of their activity in Mexico and the later work of the Mexicans are found in all parts of the republic where mineral exists. So extensive and thorough was their knowledge of mineral occurrence, one might believe that there is not in Mexico an undiscovered mineral deposit. But it does not follow that nothing is left. On the contrary, much old work was superficial and serves now to point out deposits commercially valuable that might otherwise have remained undiscovered for many years.

It is a mistake to imagine Mexico an unprospected field. The points for investigation to-day are included in the question: Will the ore already determined yield a profit under the existing economic conditions?

With reference to the west coast of Mexico, the lack of transportation facilities accounts for the slowness of development. Mineral in paying quantities exists in the ranges from the head of the Gulf of California south to the Isthmus of Panama. But along that entire length of coast line there are but two natural harbors—both in the Gulf of California—and no railroads reaching into the interior mineral regions. Mazatlan, in Sinaloa, has importance as an ore shipping point, but ore handled there is brought in by mule train over hundreds of miles of trail. This condition renders machinery installation a serious problem, but not an unsolved one. It is astonishing, after traveling over a tortuous, precipitous trail in the Sierra Madres, to suddenly come upon a large mining and reduction plant.

Traveling east and inland from the coast of Tepic, the country rises by successive steps of basaltic flows of great thickness and extent and presenting every variety of this rock. The sources of these flows are individual eruptive points occupying the country in all directions from Tepic and extending north and east into Sinaloa and Jalisco. The basalt is the cap rock in the low parts of the country and affords the approximately level areas upon which the towns are built. Forming the mass and axis of the ranges, folded and broken by the later basaltic outbursts and intrusions, thousands of feet in thickness and weathered to craggy peaks, is the basal rock of the country—andesite. The entire region is made up of the two eruptives and allied species, the andesitic varieties largely preponderating. The line of basaltic eruption is north and south, the folds and breaks of the andesite being at right angles to it, forming the drainage lines and canyons of the Sierras, which render those mountains so difficult for railroad construction. The entire absence of sedimentary rocks for hundreds of miles around Tepic is remarkable. It is an obstacle to smelting at present, the only available lime being the calcite vein matter of fissures in some localities.

For the most part the fissures of this area follow the lines of folding and are within the lighter colored andesite rocks, but are also found along dolerite dikes as contact fissures or close to the contact, within either the dike or country rock. The veins are generally large and dip nearly vertical, with irregular mineral deposition. In most instances evidence of deposition by replacement is found with the ore bodies, and is especially noticeable in the veins occurring in anorthite.

The gold content in the ores of Tepic, and of a large portion of Jalisco and Sinaloa, is very small and receives no special attention in treatment. It generally increases with the silver values. The ores over this area are much alike, as would be expected from veins occurring chiefly in andesite, rhyolite, dacite and dolerite, and carry most of the silver minerals. The surface ores, very generally worked out, are the chloride, bromide and chlorobromide of silver, and occasionally the rarer oxide, which I found in two mines in the Picacho district in Tepic. The sulphide, sulpharsenites and sulphantimonites are the chief sources of silver, the quantity derived from argentiferous galena and pyrites being relatively small. As a rule, the valuable mineral is finely disseminated through a quartz gangue and the ores require fine crushing to liberate it, which makes concentration difficult.

The coarsely crystalline sulphides carried in the vein matter—usually a mixture of galena, spalerite, chalcopryrite and pyrite, easily concentrated—are rarely of a grade sufficiently high for profitable handling. The old patio and leaching by hyposulphite of soda or lime are best adapted to the common ores, although concentration is coming more into use. Under present conditions in this part of Mexico the minimum grade of ore permissible for profitable mining is about fifty ounces per ton.

Within 50 miles of Tepic are several districts in which the veins have been worked about 300 feet down to the general water level. The veins of these districts have similar ore characteristics. The ore bodies lack definite structure and the pay mineral occurs in irregular bunches. It is sometimes very rich. With few exceptions, indications of strength are lacking and the old workings confirm what this

lack would imply—that pay ore does not occur continuously but in irregular bunches and pockets.

There are two mines operated in Tepic, the Castellana and Zapoloti. At the former, concentration is employed; at the latter, hyposulphite leaching. The product is shipped to Hamburg, Germany.

Farther north and east, in Jalisco and Sinaloa, the ore bodies are larger and mining may be begun with much more confidence in their permanency, although Tepic excels, in many places, in economic conditions.

It is frequently asserted that the cheap labor of Mexico is a great advantage in mining. My observation and experience leads to the opinion that the advantage is more than counterbalanced by difficulties that progress in the United States has overcome. With reference to Tepic, it may be said that, taking into consideration accessibility, quantity, character and grade of ores, prices and terms asked by owners, it is not so favorable a field as other parts of Mexico and not nearly so favorable as many parts of the United States, for the investor in mines.

CLARENCE S. KING.

Use of Air Drills.

Has it been demonstrated that it is not practicable to use air drills except in hard ground?

If one were contemplating the running of 800 to 1000 feet of tunnel along a partly decomposed quartz ledge, would it be advisable to use a small air drill—size of tunnel, 6x8 feet?

If the 5-foot holes would shake the ground too much, necessitating timbering, would it pay to use an air drill and put in 30-inch to 36-inch holes?

Have stoping drills been used to run a drift, and, if so, what progress could be made in moderately hard rock? Information on this subject will be much appreciated. San Francisco, Cal. W. M.

The following is in answer to the above:

If ground is hard enough to drill, power drills can be used to advantage. If the ground is not very hard, do not put in as many holes. A tunnel 6x8 certainly could be run with power drills to a profit over hand labor. He must expect some backs with an 800-foot or 1000-foot tunnel, and it is not likely that in depth his ledge will get hard? Yes; we stoppe, raise and drift, often with the same drill, 2½" Giant. When we first put in air drills we used nothing but the 3½". We did not stoppe much with them—mostly drifting and raising. Now we have no 3½" in use in the mine, 2½" being the largest. We now use the 2½" for nearly everything. We have concluded that most people are given to the use of too heavy drills. We are satisfied that we can drill almost any kind of ground with a 2½" drill. We use water with all of our machines, which is of great help in every way. Twelve hundred feet of our present shaft was a raise; we cut down the raise to make a 12-foot wide shaft; most of the cutting down was done with a 2½" Giant drill, and frequently most of the five or six holes were in hard greenstone. So we proved we could drill nearly everything with a light drill (100 pounds).

With our 2½" and 3½" drills we have two men; with the 2½" only one in any position. The total cost of a drift we ran, both with 3½" and 2½" drills, also the cost of a hard greenstone crosscut with a 2½" drill, is appended. It is to be noted that the 2½" drill is the one we stoppe with; we only use the 2½" in drifting and raising:

Drift.	Feet run in each month.	Cost per foot.	Drill.
".....	57	\$3 87	3½"
".....	40	4 57	3½"
".....	60	4 26	2½"
".....	18	4 36	2½"
Crosscut in green-stone.....	36	4 00	2½"
Drift.....	17	3 38	2½"

The above is the whole expense per foot of drift, labor, materials, caring dirt. In some places the drift was very hard, but always a wall to break to.

The labor of breaking the ground alone by contract, single or double-hand, would in no case have been taken for less than \$5, and much of it for not less than \$10 per foot. L. B. J.

Forbestown, Cal.

Inches of Water Carried.

How many inches of water will be carried by a 4-inch pipe 2 miles long, supplied by a 12-inch pipe ¼ mile long—fall from head of 12-inch pipe to junction with 4-inch, 50 feet; from junction to discharge point, 100 feet? How many inches if a 6-inch pipe be substituted for the 4-inch? How many if an 8-inch be substituted?

Bishop, Cal.

Approximately, in the first case, 10 miners' inches; in the second case, 30 miners' inches, and in the third case 60 miners' inches. These figures are, however, only approximate, as the condition of the pipes or the number of bends and style of intake are not mentioned. The first condition will be very bad hydraulic practice to put in, viz: a 12-inch pipe and a 4-inch pipe, and one that should not receive practical consideration.

THE latest consolidation in the mining industry reported to be under consideration is a syndicate to control the entire output of zinc of the Joplin district, which produces seven-eighths of the product of the United States.

A New Gasoline Hoist.

The accompanying half-tone from a photograph of the gasoline hoist, manufactured by the Machinery & Electric Co. of Los Angeles, Cal., shows many of the advantages claimed for this machine. The entire management of the machine, including the changes in speed, is done from the head end of the engine, the

New Gasoline Hoist.

operator always facing the mine shaft as well as his engine. It has helical or V-tooth gears and supported out-board bearing, a double-faced iron friction designed to lift 2000 pounds with the pressure of one finger, the friction also intended to be used in case the brake fails. Either post or strap brake is furnished as preferred. The hoist also has a variable speed control arranged to be operated at 100 revolutions per minute up to the limit of governor control. In the gasoline engine which operates this hoist the spark is located in the direct path of the incoming charge, where the points are always clean and the charge always rich enough to burn quickly, the location so designed that when the engine cuts out, the exhaust is held open and a stream of cold air passes over the points, the sparker stopping all motion when the engine cuts out. These features are designed to enable the M. & E. engine to run light all day and take but one shot at a time, each of the same force.

The Jeffrey Electric Power 48-Inch Cut Shearing Machine.

The accompanying illustration gives a clear idea of the latest designed shearing machine for coal mining,

Shearing Machine for Coal Mining.

manufactured by the Jeffrey Manufacturing Co. of Columbus, Ohio.

Fig. 1 shows a side view of the machine mounted on truck wheels. It is not necessary to remove these wheels when shearing the coal. There is no separate truck; the wheels run on gudgeons fastened to specially designed cross ties that support the outside frame of the machine.

The rack has open teeth, so that any obstacle that may lodge on it is pushed through by the feed pinion teeth, which avoids clogging and undue strain on the teeth. The cutting chain is interchangeable with

cutter chains on Jeffrey standard undercutting machine, and runs over so that as the bits come in contact with the coal all the cuttings are carried down and brought out at the bottom of the kerf, where they are easily gotten at to be removed, if necessary. This machine has been fitted with trolley pole so that it may be moved from one working face to another in mine by its own power, thus avoiding delay incident

to moving by mules or horses. It is built in sizes to shear to a depth of 6 or 7 feet, each cut being either 36" or 48" high. When a vein of coal is to be sheared, which measures more 36" or 48" thick, columns are arranged to side of machine upon which it can be raised or lowered readily by means of a ratchet.

This is only one of the styles of coal-cutting machines which the Jeffrey Mfg. Co. build; their line also includes electric and compressed air breast or chain machines, built for either thick or thin vein coal, electric locomotives, electric and compressed air drills and all kinds of elevating, conveying and screening machinery for handling coal.

Change in Steel Making.

The Bessemer process of making steel is falling into disuse, and the crucible process of making steel is also on the wane to some extent. Both are falling victims to the practice of making steel by the open-hearth process. Gradually the latter is displacing the functions of Bessemer pro-

duct, and as the quantity of ore, known as Bessemer ore, decreases, so the method will fall more into disuse. While furnaces to increase the output of open-hearth steel are being built that will aggregate more than a thousand tons per day, no Bessemer converters are being erected in this country.

Open-hearth steel is being used in many places where crucible steel formed the exclusive product formerly. The open-hearth product is making annual inroads on the crucible make. So much so that the Crucible Steel Company of America is building an open-hearth plant to supply this demand.

Hammering or forging crucible steel by a succession of blows was formerly considered the only proper method to treat steel. The hydraulic forge or squeezing process and the rolling mill are displacing the hammer to a large extent. There is no questioning the quality of hammered steel, but the loss is too great. This is incidental to the fact that hammermen are human, and have not the necessary skill or genius to guess when a piece of steel should be struck and when not. By the hammering process one part is struck a blow while at a red heat, another part while at a cherry red, and another while the metal is black. Each successive blow creates

a new structure. Where the metal is at a proper heat the granules will be forced into homogeneity; where the steel is cooling rapidly, it will jar the grains apart.—American Manufacturer.

A GERMAN patent describes "the Dile apparatus" for production of phosphorus by action of an electric current on a mixture of phosphoric acid with one-fourth of its weight of lamp black. The positive electrode is at the bottom of a covered cylindrical vessel, while the negative passes through a hole in the cover and can be lowered or raised by a screw;

it is claimed that the apparatus will work continuously without the necessity of cleaning out the residue, as only carbonic acid, phosphorus and a small amount of light ash will be obtained, the raw material being introduced through a hopper at the top.

Working Silver Ores in Pachuca, Mexico.

At Guadalajara, Jalisco, as related in Mines and Minerals, the ore arrives at the mills direct from the mines in big pieces (about 10-inch cubes), is broken to small pieces (about 1½ or 2-inch cubes) by crushers and afterwards reduced, with a supply of water, to a fine pulp in stamp batteries or Chilian mills so that it will pass through a 90-mesh screen. The fine pulp is delivered by launders to settling tanks, which remove the water, and the pulp is then placed in large, shallow tanks and exposed to the heat of the sun in a yard until the ore is dry. In the rainy season the ore is dried on iron plates over a furnace. When the pulp is dry it is taken to bins over the "tunnels" (amalgamating barrels). The charge for each tunnel consists of from three to four tons, which is mixed with about 13%—by weight—of common salt. The ore and salt are charged into the tunnel with hot water. The water is measured so as to obtain a stiff pulp which will support the amalgam in place of allowing it to remain in the bottom of the barrel. (It is possible to take the pulp in the hands and press it into a ball, plainly showing the marks of the fingers.) The tunnel is run for about half an hour and then the "reactrio" (reagent) is charged into the tunnel. The reactrio is a solution of protochloride of copper in a saturated common salt solution, and is prepared in the following manner: A saturated solution of common salt is prepared in a wooden tank and sulphate of copper added. This is boiled by a current of steam. The reaction which ensues reduces the sulphate of copper, forming bichloride of copper and sulphate of soda. The solution is green and all the sulphide should be dissolved and transformed in half an hour. Metallic copper is then added and two ounces of sulphuric acid, which is intended to clean the surface of the scrap copper. The solution is again boiled with steam. In this case metallic copper acts on the bichloride of copper to form a protochloride of copper, some of the metallic copper being dissolved in the action. This reaction requires about half an hour. The liquid, which was at first green, changes color as the reaction advances. The proper color for the end reaction would chemically be a clear solution, but generally it is the color of cognac, caused by the suboxide of copper which is reduced from the chloride by the atmospheric air, thus giving the liquid the color of cognac at the end of the reaction. The liquid is kept hot so as to keep the chloride of copper in solution. To test the liquid, a little of the hot solution is poured into clean cold water, when there should be a white precipitate of protochloride of copper. The solution is kept and used hot, on account of the fact that the protochloride of copper is only soluble in hot salt solution. It is for this reason, also, that salt and hot water were added to the tunnel when it was charged. The reactrio is charged into the tunnel and after it the mercury. The tunnels are then run for about six hours, when the amalgamation should be ended. Plenty of water is then added to wash out the pulp which is allowed to flow into the tanks where the amalgam is separated. Generally there are three wooden tanks for washing the pulp and these are provided with agitators. The reactions which take place in the tunnel are as follows: Any sulphides of silver are converted into chlorides of silver, the protochloride of copper being at the same time converted into a sulphide of copper. Previous to introducing the mercury into the tunnel it has been amalgamated with zinc or lead, and the chlorides of silver act on these metals, converting them into chloride of copper or chloride of zinc, the metallic silver formed being taken up and amalgamated by the mercury. If this precaution is not taken the mercury itself would be attacked by the chloride of silver, to form chloride of mercury and metallic silver, thus causing serious loss of mercury. When the silver is present as a double sulphide of silver and antimony or arsenic, chlorides of silver and antimony or arsenic will be formed by the protochloride of copper, the chloride of silver being reduced by the zinc or lead as in the case above. Native silver will be taken up at once by the mercury, while chloride or bromide of silver will be decomposed by the mercury, zinc or lead and amalgamated. The tunnels have four beams of wood extending longitudinally through them to aid in moving the mass. The mechanical losses of mercury in this process are very small and about 95% of the silver is saved. If galena, pyrite or manganese is present it will maintain its silver and may be concentrated from the tailings. Sometimes, when much galena is present, the ore is concentrated first to obtain the galena as a concentrate, which is sold to the smelters, the tailings from the concentrates being treated as above described. The object of this concentration is to remove the galena previous to the amalgamation, as on account of its great specific gravity it interferes with the cleaning up of the amalgam. When mercury is being lost mechanically, more water is supplied to the washing or cleaning tanks. If the ore contains

greasy clay, it interferes seriously with the amalgamation, on account of the fact that the clay covers the surface of the mercury. Any free gold in the ore is obtained in the amalgamation. At Pachuca the ore is generally obtained in quartz and with very little clay, the silver being mostly in the form of a sulphide, together with considerable polysulphide of silver, antimony and arsenic and a little argentiferous galena. This ore is successfully treated by the above process. In other places, where the ore contains copper minerals and complex sulphides, it is first roasted with salt, which converts the silver into the form of a chloride previous to amalgamation.

Telephones in Mines and Hotels.

In the modern mine telephones are now considered part of the equipment. After many unfavorable experiences, engineers and superintendents have discarded the cheap and inefficient telephone apparatus and are choosing more for quality and durability than price. The same way in hotels, the new Hotel Essex, N. W. 56th St. & Madison Ave., New York City, is equipped with genuine Ericsson telephones and

Telephone for Mines and Hotels.

switchboard. The room telephones are all of the hand micro-telephone pattern, as shown in cut A, each fitted with a flexible cord of sufficient length to enable the patron to call the office, or to answer a call if desired, without rising. When through using, the releasing of a lever in the handle makes and breaks all necessary connections and it is not necessary to replace on a hook, as in ordinary telephones. In operation, the office is called by simply pressing the contact in the handle of the hand micro-telephone, which act throws the drop at the switchboard. The operator connects in the usual manner, answering the call, and, if desired, calls some other suite and enables the two to converse. As shown in cut B, the wall telephone is compact and takes small space. It is fitted with the standard Ericsson receiver and transmitter. In operation it is used in the usual way, the act of taking the receiver from the hook sending the call for the operator in the office. With both instruments, when the line is released, the operator is at once notified and quickly disconnects. The switchboard is shown in cut C.

In addition to this system, the Ericsson Telephone Co., 296 Broadway, New York City, make a number of different systems and telephones of special design

and finish for special uses, including intercommunicating patterns and for exchange use. They make a specialty of supplying mines with durable and satisfactory telephone service.

Steam Engine Economy.

All prime movers using steam are in reality heat engines, the steam being merely the carrier of the heat from the boiler to the engine. Water or steam may be used over and over again, but the supply of coal or other fuel—the real source of the expense—must be kept continuous. It follows that the only scientific and accurate mode of expressing engine economy must be in terms of the amount of heat used per unit of power developed in the unit of time.

To thus determine engine economy there must be given, besides the consumption in pounds per I. H. P. per hour, the temperature of the feed water and the pressure or temperature and quality of the steam. With this data and the aid of steam tables the heat units required per minute or load can be readily determined.

To illustrate, suppose an engine consuming 16 pounds per I. H. P. per hour and the additional data: feed temperature 160°, steam pressure 150 pounds gauge, quality 98% dry, then using the steam tables:

	Degrees.
Temperature of steam is.....	365.9
Heat in 1 pound water at last temperature.....	338.0
Heat in 1 pound feed water at 160° = 160 — 32 = ..	128.0
Heat needed to raise 1 pound of feed to boiling point.....	210.0
Latent heat 1 pound steam.....	855.6
Ninety-eight per cent of preceding.....	838.5
Heat required per pound moist steam formed = 210 + 838.5 = ...	1048.5
Heat required for 16 pounds = 16,776° = heat per I. H. P. per hour.	
Heat required per I. H. P. = 16,776 ÷ 66 = 279.6°.	

These last statements are accurate and complete, and make possible the determination of the efficiency of the engine. One H. P. = 33,000 foot pounds of work per minute. In heat units (B. T. U.) this is 33,000 ÷ 778 = 42.42. Then in the illustrated case it has required 279.6 heat units to get the equivalent of 42.42. The efficiency is thus 42.42 ÷ 279.6, or 15%.

The importance of the efficiency so determined for comparisons of economy is illustrated in the following case:

- (A) Steam consumption 18 pounds, temperature feed 180°, steam pressure 85 pounds, quality 94% dry.
- (B) Steam consumption 17 pounds, temperature feed 100°, steam pressure 200 pounds, quality 99% dry.

Determining as before, using the tables, the heat required would be: For A, 294.4° per minute, and for B, 318.3° per minute; so that while by the steam rating B would appear to be the more economical, by the heat rating exactly the reverse is the case, A being the more economical by 8%.

Another case where the rating in terms of steam or water per I. H. P. per hour may give a very incorrect idea of the real engine efficiency is where the engine is located a long distance from the boiler, with a poorly protected steam pipe connection. Under such conditions much heat will radiate through the steam pipe and not reach the engine at all, and the real engine supply is part steam and part water, instead of being all steam.—Condensed from *The Engineer*.

It is fairer to the engine to reduce the consumption to heat units, the thing really consumed. The wide margin between the theoretical perfect utilization of all the heat and the heat actually used would then be forcibly brought to the attention of every steam user, and would prove a constant stimulus to improvement, tending to raise the average efficiency of engines, even if no startling changes in practice would result.

The Alaska Commercial Co., Alaska Exploration Co., Seattle-Yukon Transportation Co. and Empire Transportation Co. have consolidated into two new New Jersey corporations, the Northern Navigation Co., which will take over the transportation business of all the four, and the North Commercial Co., which will take over and do a strictly trading business. Each of the new corporations is capitalized at \$7,000,000. The territory covered by the operations of the companies combining includes St. Michael, Behring Sea, Cape Nome, Port Clarence and Yukon districts. Thirty-six river boats, but no ocean steamers, were transferred, and no mining properties were transferred, though all of the companies combining own in part or whole many mines. The North American Trading & Transportation Co., the Chicago Corporation, in which the Cudahy's and Weares are interested, did not go into that combination.

The Iron Age says that in this country the wage earner represents not a class, but a condition—as temporary as he may choose to make it. "The conditions of emancipation from wage service are industry, self-improvement and the homely virtues of economy and thrift. The relation of those representing the different conditions in the industrial scale is

constantly changing in obedience to a natural law much like that which, in the ore-jigging operation, separates masses of matter according to their respective specific gravities. We find very few employers who have not at some stage of their careers been wage earners—not in an amateur way, but because no other means of starting in life was open to them. For this reason it is misleading and mischievous to talk or think of such impossible abstractions as a 'working class,' a 'laboring class' or a 'wage-earning class.' These so-called classes may and do merge together in a way which would be impossible if separated by any real class distinctions. Hence we are compelled to share with most students of economic and social problems the disapproval of any plan for assisting the wage-earner which puts him on any other plane than that which every other capitalist, large or small, must occupy. Self-reliance and independence of judgment are and must ever remain his chief aids to advancement in life."

Mining and Metallurgical Patents.

Patents Issued April 2, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE ROASTING FURNACE.—No. 671,071; R. F. Pearce, Butte, Mont.

Combination with outer solid wall and inner horizontally-slotted wall, of column spaced apart from inner wall, and cantilever support for portion of inner wall above slot, comprising trussed chord projecting from column and connected with inner wall.

QUICKSILVER RECEIVER.—No. 671,069; F. Kaefeler, Hanover, Germany.

Combination of chamber Q with entrance R for mercury and fluid, a vertical conduit in communication therewith, a partition W at upper end, means of communication, l, below partition between conduit and annular chamber Q' placed above chamber Q, means of communication, l', above partition between chamber Q' and atmosphere, accumulation chamber Q² concentric with Q' having holes, s, in wall C for admitting mercury from annular chamber, and provided with orifice, m, at lowest part for return of mercury to chamber Q and screw spindle, n, for closing orifice.

ORE CONCENTRATOR.—No. 671,276; A. Fritsch, St. Louis, Mo.

A base, standard frames supported above, cams under certain frames for raising and lowering them, lever for operating cams, lock for retaining lever and cams in adjustment, table supported to swing between frames, means for passing material onto table in thin stream, series of curved and tapering

guides regulating movement of ore, operating shaft, means operated by shaft for forcing table rearwardly whenever rotated, and separate means for drawing table to front.

AIR COMPRESSOR.—No. 671,044; G. S. Binckley, San Francisco, Cal.

Combination with compressing cylinder, of piston of relatively movable sections, constituting air admission valve during one stroke and compressing piston during opposite stroke, drive shaft and connecting rod connections between each piston section and drive shaft, connecting rod connections having separate pivoted connections with respective sections, so sections advance toward and from each other upon changed angularity of rod connections during revolution of drive shaft.

PUMP.—No. 671,090; J. S. Morton, Oakland, Cal.

Means for raising fluids, comprising series of helical runners secured upon rotatable shaft in combination with similar series of reversely formed helical runners, each element of each series separated from adjacent element and provided with a plate upon one face of less than its diameter but larger than that of hub and means to prevent rotation of fluid between adjacent elements of series of runners.

ORE CONCENTRATOR.—No. 671,348; J. H. Michelsen, Butte, Mont.

Combination with main frame, vibratory table

mounted thereon, means carried by frame for adjusting height of one side of table, and means for delivering material upon table; main driving shaft, pitman connected to operate from main shaft, connecting-rod connected to table, frame secured to connecting-rod, compound toggles mounted in frame, one pair of toggles forming connection between frame and main frame, and toggle forming connection between pitman and toggles.

METHOD OF TREATING ORES.—No. 671,389; M. Seligsohn, Denver, Colo.

Process of amalgamation consisting in introducing into ore pulp air impregnated with two or more chemicals by mutual reaction to promote amalgamation and prevent sickening of mercury.

DISTILLATION OF PETROLEUM.—No. 671,078; J. T. Davis, San Francisco, Cal.

Producing residuum for use as binder for artificial fuel, in incorporating with crude petroleum suitable oxidizing agent, such as bichromate of potash, distilling petroleum to temperature above 600° Fahrenheit, below carbonizing point of residuum, introducing steam into petroleum from below, in its passage upward to dissolve oxidizing agent, continuing distillation at temperature given, until residuum has reached condition desired.

Dredging Difficulties.

Some difficulties encountered by dredges upon river and beach claims of the west coast of New Zealand are the obstructions from huge boulders or from buried timber. The first obstacle that is met with in any attempt to overcome them is the fact that the work is carried on in the dark. The dredger buckets meet with large logs which may lie endwise or crosswise. These must be removed by finding out the position of the obstruction and adapting such means for its removal as would be used on land. The first requisite, then, is to find out the nature and the position of the obstruction, which means seeing it. There seems no great difficulty in the way of constructing apparatus to see at the foot of the ladder. A light, water-tight cylinder fitted with a suitable glass at the bottom could easily be constructed. Perhaps more lenses than one would be an improvement. This "water telescope" could be let down right on to the obstruction, so that there would be little intervening water to look through. Probably also an electric light, with a reflector, to light up the obstruction, might be necessary. It might be convenient to adopt such telescopes to each side of the ladder, so that they might always be available. Having by some means located the obstruction, the problem of its removal would be much simplified. In the case of logs, connection would have to be made with a steel rope running through a pulley behind the dredger to a winch on deck. This connection might be made with dog hooks, or it might, indeed, be necessary to have a diving apparatus and a diver to make the attachment. Or it may be found necessary to have each ladder fitted up with an air-lock cylinder for this purpose. In conjunction with this, a circular saw driven by chain gearing, to cut up the logs, will be required. —Condensed from New Zealand M. & E. Journal.

Tamping Blasting Charges.

TO THE EDITOR:—Is tamping necessary in charging holes in rock with dynamite? If so, why? These are questions I have asked practical miners of from one to fifty years' experience without getting a satisfactory answer. Some are bold enough to say what kind and how much tamping to use on top of dynamite charges, but none say why it is necessary to use tamping at all. Text-books used in some mining schools say what kind of rods should be used in tamping holes, thereby assuming that tamping is necessary. One writer in the MINING AND SCIENTIFIC PRESS said: "Only enough tamping to exclude the air from the dynamite is necessary."

I have blasted holes in many different kinds of rock in practical work in mines, from British Columbia to Mexico, with small amount of tamping—enough to exclude the air from charges—and with no tamping at all, without being able to appreciate the difference between the efficiency of the blasts with and without tamping.

Say one had a 5-foot hole charged with 3 feet of dynamite, would it not be better to have the resistance of the air in the unoccupied portion of the hole (2 feet), than to pump the air from the hole, and seal the collar of the hole with a thin sheet of air-tight sealing wax?

PRACTICAL MINER.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Patrick Clark is reported to have bonded quartz claims near Nome. The ore body is said to be several hundred feet wide and to be free milling.

The Yakima mine, on Douglas Island, is reported to have been sold for a large sum.

The Lucky Chance, in Sitka district, claims to have a shoot of \$50 to \$75 ore blocked out. A wire tramway has been built to connect the mine and 5-stamp mill.

W. A. Mix will hydraulic in Porcupine district this season.

The Alaska Steam Coal & Petroleum Co., J. Hamilton manager, has commenced drilling for oil at Kayak, near Cook Inlet. The company has a standard rig and expects to have to drill 1200 feet. Petroleum has been noted seeping freely from the ground at Kayak.

ARIZONA.

COCHISE COUNTY.

The Lake Superior & Western Dev. Co. have taken over the eleven claims at Bisbee which they have been developing under bond. The price paid is reported as \$500,000; J. L. Merrilland is Supt.

COCONINO COUNTY.

Several hundred placer locations of supposed platinum deposits have been made by M. C. Sharpneck and A. A. Coupland of Coconino for Eastern people. The platinum deposits are said to exist in Cataract canyon. This has been exploited once and demonstrated to be without foundation.

GILA COUNTY.

It is reported that the management of the Ray Copper Co. has passed from the English stockholders to the Seligmans of New York and L. Zeckendorf of Tucson.

Surveys are being made to develop the water power of Salt river. It is intended to supply 3000 H. P. to Globe and vicinity. C. M. Clark of Globe is at the head of the proposition.

From Old Dominion C. M. & S. Co., Globe, statement from formation of company to Jan. 1, 1901: Value of copper, silver, gold produced, \$3,567,558; less cost of production at mines and smelter and electrolytic refining, \$2,161,293; all expenses of handling copper, such as freight, copper charges, commissions and expense account, \$553,305; total expenses, \$2,714,597. No sulphide ores have been found, but oxidized ore bodies continue in depth. The production of copper for 1900 averaged 750,000 pounds monthly.

The Black Warrior C. Co. are reported as intending to add acid works and a refining furnace to their already large plant at Globe. The company is at present without fuel to operate, owing to the continuance of the coal strike.

MARICOPA COUNTY.

The new owners of the Vulture mine at Wickenburg, G. W. Sanders, superintendent, are reported to intend increasing the mill water supply by a new pipe line from the Hassayampa river, adding to the cyanide plant, and building a concentrating mill for the low-grade ores.

MOHAVE COUNTY.

H. Hubbs, Kingman, claims to have struck a vein of silver-lead ore in the Walapai mountains.

Ore has been found in lower workings of the Empire mine, Kingman, that is said to be rich. The mine is bonded to J. P. Finegan and A. Conkey of Chloride.

PINAL COUNTY.

W. D. O'Neil has bonded the Bay State mine, at Florence. At a depth of 200 feet the vein is said to be large and to average close to 100 ounces of silver.

YAVAPAI COUNTY.

The Congress mine, on the Santa Fe, Prescott & Phoenix R. R., is sold by the Congress G. M. Co. to Eastern men for \$2,000,000. The purchasing company will be headed by E. B. Gage, now president Congress G. M. Co. W. Miller of New York and W. W. Grout of Vermont are interested.

YUMA COUNTY.

C. H. Gray's mine, 45 miles west of Ehrenburg, is reported to have yielded \$17,000 from a recent mill run.

CALIFORNIA.

ALAMEDA COUNTY.

Manganese ores are mined at Livermore by J. W. Merchant. The ledge is worked in open cut and the ore is said to carry about 70% mineral, black oxide.

AMADOR COUNTY.

It is reported that Alvinza Hayward will build an electric power plant on Dry

creek, near the Centennial mine, Plymouth, to supply the northern portion of Amador county with power.

The Con. Jackson Co. propose to start work on the Fleming mine at Jackson. N. Mirionvich and Glavich Bros. cleaned up \$4000 from a twelve days' run of their gravel mine near Oleta.

BUTTE COUNTY.

The Golden Trout mine, N. Lambert foreman, have surveyed a ditch to bring the South Fork and tributaries to the mine for power. They expect to develop 500 H. P. A 20-stamp mill is being built.

INYO COUNTY.

Discoveries of nitrate beds are reported from Death valley equal in quality to the Peruvian deposits. Three claims are reported to have been sold recently.

KERN COUNTY.

The Cresson Co. expect to put in immediately a 40-ton cyanide plant on the Pinon mine, Randsburg. They estimate 8000 tons of tailings on their dump already.

The Butte mill run of 7½ tons yielded \$10,300 in gold.

W. Inman has struck a ledge of \$30 rock in the Kinyon, Randsburg.

MADERA COUNTY.

The N. Y. Exploration Co. has acquired the old Fresno Enterprise mine, near Ahwanea. It will be operated by Capt. H. H. Todd.

MARIPOSA COUNTY.

English people are said to have bought the Red Cloud mine, near Coulterville. W. P. Jones is superintendent.

The Mariposa Com. & M. Co., J. H. McKenzie manager, have bought the Brown mill, below Tuttletown, and are moving it to Princeton, where it will be added to the plant on the Mariposa grant. The company, so the manager states, would like to purchase another twenty stamps, and parties having such a mill for sale can address Mr. McKenzie at Mt. Bullion postoffice, Mariposa county.

At the Hite Cove mine 100 tons of tailings are cyanided daily. It is estimated that there are 40,000 tons of tailings which will yield \$5 and cost for treating 50 cents per ton.

MONO COUNTY.

The Blue Vein mine, at Bodie, is being prospected on the 200-foot level. The owners are said to intend to put up a 5-stamp mill and tramway.

NEVADA COUNTY.

At the Champion mine at Maybert a tramway, 10-stamp mill and compressor have been installed. Supt. English expects to run the mill on a recent strike of a large ledge of pay ore.—At the old Yuba mine a good-sized ledge has been uncovered and the mill has been running for the past month.—Development work is going forward rapidly at the Eagle Bird, superintended by Alex. Wilson.

The Wright & Bailly quartz mine, Sweetland, is sold to San Francisco men for \$8000. Shafts will be sunk on the property.

PLACER COUNTY.

The Pioneer-Lynn G. M. Co., Towles, report a small cleanup at the mine during March.

At the Eureka Con. drift mine, Centerville, a lead of pay gravel has been struck on the west rim 12 feet up from the pay channel lately cut by the bedrock tunnel.

SAN BERNARDINO COUNTY.

A strike is reported in the Ovid district, near Victor, a ledge 8 feet wide opened by a 60-foot shaft and crosscut. The find is iron oxide carrying wire gold and native silver.

SAN DIEGO COUNTY.

The Golden Cross at Hedges is still in litigation. The Free Gold M. Co. is suing J. Spiers and others for the possession of the mine, \$50,000 rents and \$200,000 damages.

SHASTA COUNTY.

J. Fisher and F. Ormsby are operating the Globe at Igo. They have made several shipments of concentrates and selected ores.

The Clover Creek Cinnabar Co. are sinking on the ledge. The cropping indicates about 20 feet width.

The Gibson and Apfel ranches, on Clear creek, near Redding, have been bonded by a dredging company and prospected by a drill. It is reported that a dredger will be installed.

J. W. Turner of Eureka has bonded the Harrison group of copper claims on Cow creek at \$45,000, operations to begin within ninety days.

At Redding is being tried in the Superior Court the suit of the Balaklava M. Co. vs. the Iron Mountain Investment Co., the development branch of the Mountain Copper Co., for possession of the Balaklava copper mine near Copley and for \$25,000 damages and costs. The action arises from a \$200,000 bond which the Iron Mountain

Co. held upon the Balaklava, and involves a tender of payment made by telephone after bank hours on the last day of the bond's life. The Iron Mountain Co. will probably lose the suit.

J. R. DeLamar has transferred to the Bully Hill Copper M. & S. Co., in consideration of \$2,249,000, the Bully Hill mines and smelting plant near Copper City, 26 miles northeast of Redding.

SIERRA COUNTY.

F. C. Le Blond and W. E. Olmstead have applied to the U. S. Debris Commission for permits to hydraulic the Chaparral Hill mine, depositing tailings in Good-year creek. Other applicants from this county are Ah Lung to mine Fuller Flat mine near Scales, and J. H. Skinner the Lava Point mine at Hepsidam.

SISKIYOU COUNTY.

The Siskiyou Hydraulic M. Co. are working 100 men at their hydraulic mines in the South Fork and Wildcat creek, Callahans.

The Consolidated M. & D. Co. are working two hydraulic claims at Callahans and have bought up large tracts adjacent, which they propose to work by dredging.

Carlock & Morrison are developing their quartz mine, near Etna, on a large scale; twenty-five men are employed.—P. Thompson, Yreka, has taken out a 17-ounce nugget from Humburg canyon.—Rich pay is said to have been taken out on the South Fork of Scott river from gulches and tributaries, especially Boulder creek. A ditch is being constructed at Frenchtown, where claims have been bonded by a French company.—A. C. Brokaw, Etna, is working the R. H. Campbell hydraulic mine, Quartz valley.—Quigley & Geney, Etna, are reported as contracting with Eastlick Bros. to work the Quigley & Geney claim, Oro Fino, by elevators.

TRINITY COUNTY.

On the Lawrence mine, near Trinity Center, the ledge in the main tunnel is from 6 inches to 3 feet wide. A lower tunnel has been started to open the vein 200 feet down and a mill is projected to replace the present 5-stamp plant.

The C. P. R. land department is protesting in the land office at Redding the issuance of a placer patent to 240 acres of land claimed to include the Closs & McClary channel. The mine claimant, M. H. Macmillaine of Abrams, has offered testimony to show that 15 to 40 feet depth of pay gravel existed on the land.

The second tunnel on the Sweepstake, Weaverville, struck gravel near the rim rock, which is pitching down.

The Ajax group, Weaverville, is bonded to C. D. Galvin. The group is on the Sweepstake channel.

Cochran, Brady & Tourtellotte have bought the boiler and hoist of Adele mine, at Lewiston, for the Lappin mine, Deadwood, and will sink from the 100-foot level to 200 feet, and if the ledge holds will put up a stamp mill.

TUOLUMNE COUNTY.

Superintendent C. L. Lang states that contracts will soon be let for grading for the new hoist and mill at Big Oak Flat, where a shaft will be put down.

McSorley Bros. are sinking on the Emma mine, Campo Seco.

Ogden & Peabody have struck pay gravel in their mine on the White Lead at Columbia.

YUBA COUNTY.

At the Golden Trout mine, A. J. Waterhouse, Supt., Strawberry Valley, the shaft is down 110 feet and tunnel in 240 feet. Thirty men are employed. The ledge shows excellent rock. A 20-stamp mill is now being constructed.

The last obstacle, as far as known, in securing land on which to construct the Deguerre debris dam on the Yuba river has been removed by a compromise of the condemnation suit brought by the Government against S. Harriman. The Government now has the title to all of the land.

COLORADO.

BOULDER COUNTY.

The Great Enterprise, at Eldora, C. W. Shanahan Supt., is working twelve men.

The Blue Grass M. & M. Co. is reported to have struck 2-ounce ore in the Senator Tillman, near Phoenix.

The Three Strikes M. Co., at Eldora, is shipping regularly, some being high-grade ore containing petzite.

C. L. Schellenger, manager Denver Tunnel Co., Boulder, states that they will build an extensive plant of machinery soon and drive the T. & D. tunnel to cut four veins on the Denver group.

Mr. Taylor, Magnolia, has struck ore in his tunnel in the upper camp assaying ten ounces gold and upwards.

CLEAR CREEK COUNTY.

The Abbandwal M. Co., so Manager J. Owen states, has decided to put machinery on the Morning Star mine, at Idaho Springs. He says the improvements will

consist of boiler, engine and compressor plant.

The Colorado & California M. & M. Co. has added four new concentrators to its mill at Idaho Springs, to treat ore from the Crown Point and Virginia mines.

Doherty & Gordon, operating the De Lesseps mine, Idaho Springs, say they will install a 40 H. P. gasoline hoist. They intend sinking to drift under the ore body now exposed.

DOLORES COUNTY.

The reopening of the Atlantic Cable M. Co. mine at Rico is reported after a month's trial run of the mill to be a success. The mill has been changed to a stamping and concentrating plant and is treating zinc-lead ore.

EL PASO COUNTY.

The old Lincoln mine, near Gillett, will be started again.

GILPIN COUNTY.

The Ohio tunnel, Black Hawk, owned by the Oro M. & M. Co., H. R. McClellan of Denver manager, has been driven into the mountain 61 feet, a fair showing of mineral obtained.

Shipments of smelter ore and concentrates for March from Gilpin county were 5561 tons, a small increase over February.

The Randolph 50-stamp mill at Black Hawk treated four cars of ore which produced eighty-four ounces of gold. Manager Stockbridge says the ore was taken from a pillar left in former workings and was let out on tribute.

The Freedom, Central City, is producing smelting ore averaging \$115 per ton, stamp mill ore running four and a half ounces gold per cord, and concentrates from \$19 to \$22 per ton. Regular shipments of both classes of ore are made.

The East Whiting, property of the Grand Central G. M. Co., Central City, Manager McMasters, is being developed in a fine shoot of ore. Forty tons shipped to the Rocky Mountain mill at Black Hawk produced over \$75 per cord.

A strike has been made at Black Hawk by the Gower Mines Syndicate, T. Dunstan, Supt. The find is in the seventh level, 500 feet down, west of the shaft.

A carload of ore from the P. K. mine, Black Hawk, gave values of 151 ounces silver, 5½ lead and .10 ounce gold per ton.

The Patch M. Co., operating the California mine, have put in a new wire rope, replacing the one recently broken. Mr. McCann, the manager, anticipates unwatering the 2200-foot shaft by May 15.

The Oro M. & M. Co., Gilpin, have their tunnel on North Clear creek in 65 feet; H. R. McClelland is Supt.

The Two-Forty M. & M. Co. has incorporated, to operate in this county; offices in Central City and in Rock Island, Ill.

The Specie Payment mine, on Bellevue mountain, Gilpin, shipped forty cords in March to stamp mills at Black Hawk and some smelting ore to Idaho Springs samplers; E. W. Williams is manager.

HINSDALE COUNTY.

The Golden Fleece, near Lake City, is reported to be in pay ore in the lower tunnel 2400 feet in. A rich stringer cut at 2100 feet was followed 300 feet, opening into a 2-foot pay streak.

LAKE COUNTY.

The Elkhorn at Leadville has been started up by the Elkhorn M. Co. of London. Men are cleaning out the water down to the 340-foot level, drifts from which point will go north and west to prospect.

The Empire Co. at Leadville, H. Collins manager, have developed ore in a series of caves. One of them can be examined for 150 feet. All in the bottom are caked with iron ore and lime. Along the side walls some good veins of ore are found. The discoveries are at a depth of 250 feet. The shaft will be pushed 75 to 100 feet farther and extended under the caves.

Dewey & Robinson are unwatering the shaft of the Bug G. M. Co., at Leadville, preparing to sink deeper and to continue the drift from the bottom of the shaft. A large body of low-grade ore is cut by shaft and drift that can be profitably milled; the company intends to install a plant.

The output of the Iron-Silver M. Co., Leadville, for March was 8000 tons. Much of the ore is low-grade sulphide. The Stevens shaft is sinking for the lower sulphide ore zone.

The first shipment of the New Fryer Hill M. Co. has been made. The company, 200 feet south from Buckeye No. 1 shaft, encountered a large body of good grade iron, from which shipments have commenced. The iron has a vein of lead running through it, which increases the value.

LARIMER COUNTY.

J. Trescher and associates have bought a group of copper claims about 25 miles northwest of Fort Collins, which they propose to develop this season.

OURAY COUNTY.

The Newsboy M. & M. Co. has been in-

corporated to work the Newsboy group at Ouray. W. H. Allen is manager. The main tunnel is in 2200 feet. At present hand work is employed, but it is the intention of the company to install a compressor plant and to erect a 100-ton mill to treat the ore at the mine and thus save haulage costs on the low-grade ore.

H. H. Barbee and H. McMasters are reported to have bought a group of claims in Imogene Basin. The group is developed by several tunnels and shipments are being made.

The Ouray M. & M. Co. has bought the Fredonia claim, next the Camp Bird, for \$20,000, and a tunnel will be run to open it at 2000 feet depth.

H. H. Barbee, H. McMasters and others of Colorado Springs have bought eighty-five acres near the Camp Bird, Ouray, for \$100,000. The property is opened by a 3000-foot tunnel. The owners will extend this tunnel.

PARK COUNTY.

The Cincinnati G. P. M. Co., near Fairplay, are adding a second elevator to their plant.

The Platte Valley G. P. M. Co., Fairplay, is building a dredger, and will employ a drill in testing the ground and marking out a course for the dredger.

SAN JUAN COUNTY.

J. J. Yeckle, manager of the Sunlight M. Co., operating the Evening Star group, says that in running the lower tunnel they have 4 feet of rich ore, assaying from 60 to 100 ounces silver, \$7 to \$10 gold and 10% copper.

Chicago people have bought a group of twenty claims at Silverton, on which they propose to put a mill. The ore is said to run \$16 a ton.

SAN MIGUEL COUNTY.

The Tom Boy, at Telluride, is credited with a recent shipment of \$30,000 gold.

The Smuggler-Union, at Pandora, is reported to intend adding forty stamps and a gravity tram to their plant, to handle ore from the Contention group.

SUMMIT COUNTY.

The North American Gold Dredging Co., Breckenridge, has been reorganized and will operate two dredgers this summer. B. S. Revett is manager.—The Mecca Co. claim to have obtained \$80,000 in six weeks' work last season with five men.—The Oro Grande Co. will work this season with two elevators.

TELLER COUNTY.

The Western G. M. Co., Cripple Creek, elected W. A. Otis, W. P. Sargeant, H. L. West, James A. Howe and W. H. Leffingwell directors. The capital stock was increased \$350,000, to provide for the development of the Galena hill group.

A strike has been made on block No. 2 of the Vindicator, in a drift east of the shaft at a depth of 900 feet. The shoot contains a wide streak heavily charged with sylvanite. Assays from it are said to show \$20,000 to the ton.

The Portland, Cripple Creek, has a contract with the railroad to ship 700 tons daily, three times the current output.

The Mobile G. M. Co., owning the Last Chance mine, Cripple Creek, will lease part of it to an Eastern syndicate starting operations in the district. Certain portions will be reserved to be worked by the company.

Work is being pushed on the Hull City placer of the Independence Con. Co., under lease to King & Whiting.

The Head lease for eighteen months yet on the Prince Albert, Cripple Creek, has been bought by R. H. Reid and W. P. Dunham of Denver for \$6000. The new lessees expect to put in machinery to work a heavy tonnage.

The El Paso Con. G. M. Co. has bought the property of the Kimberly G. M. Co. at Cripple Creek for \$240,000 in stock of the reorganized El Paso Co.

The Blue Bell Co., Cripple Creek, has leased 500 feet of the Blanche claim to J. Ryan & Co., who will commence active development work at once.

In a suit for commission on a mining sale that was never made the court has awarded the plaintiffs \$200,000. The suit was brought by Benjamin F. Seymour against E. A. Colburn. The latter owns a controlling interest in the stock of the Gold King M. Co. of Cripple Creek. A contract was made last June, the complainant alleging, by which Colburn agreed to pay Seymour \$200,000 if he found a purchaser who would pay \$2,000,000 for the mine. H. H. Frambach was interested in the deal, but Colburn then refused to sell.

Lessee Osgood has put more miners on the Victor, Cripple Creek, to rush out the ore exposed before the lease runs out.

The Blue Bird shaft at Victor is down 800 feet.—W. S. Stratton, it is said, will sink a new shaft 1000 feet on the Matoa.

The Rio Grande sampler at Cripple Creek handled 8000 tons of ore, averaging \$50, during March.

The Monarch M. & L. Co., leasing on

the World's Fair of the Gold Bond Co., at Cripple Creek, are reported to have found a vein 2½ feet wide with a 4-inch streak, going \$400 to the ton.

H. Tryer is sinking a 600-foot shaft on the Pharmacist, at Cripple Creek.

The Gold Dollar Co., at Cripple Creek, is making a crosscut at the 240-foot level to strike an ore shoot developed in the upper levels. The mine is producing thirty tons of ore daily.

The Modoc M. Co., at Cripple Creek, is to have a sinking plant on the Ocean Wave shaft identical with that on the Gold Coin, so Manager Frankenburg says. It is intended to mine the Last Dollar vein to a depth of 1000 feet. The present output of the mine is said to be 300 tons monthly.

J. E. Ridgway of Philadelphia has bought a half interest in the Hale & Holmes claim, adjoining the Golconda, for \$13,500. Explorations indicate that the Golconda ore shoot extends into the Hale & Holmes claims.

Lessee Maynard of the 500-foot level, Moon Anchor, Cripple Creek, reports that the ore shoot was cut 20 feet above the level. The shoot is said to be better at the point where found than in the upper levels.

IDAHO.

ADA COUNTY.

The Rock Creek M. Co., Boise, W. McKinley, manager, have let a contract to sink a shaft on the I. X. L. mine on Rock creek.

HAILEY COUNTY.

A 5-foot ledge of good ore has been struck in the tunnel of the Idaho M. & M. Co. on the Jumbo group, near Hailey; so D. McKenzie, manager, says.

IDAHO COUNTY.

The Blue Jacket Co. proposes to develop several claims at Seven Devils and increase its output.

LEMHI COUNTY.

The Daisy group of nine claims, near Salmon City, has been bonded to R. Bell for Eastern people.

B. F. Ibach, Salmon, says that the tunnel on the Kittle Burton group is in 130 feet on a ledge of free milling quartz. He has a 3-stamp mill which he proposes to run all summer on ore from the mine.

NEZ PERCES COUNTY.

The Columbia G. M. & M. Co. of Lewiston has elected C. H. Harding president and D. Trullinger superintendent. They are working three claims in the Dixie district and claim to have uncovered a ledge of free milling ore 24 feet wide on the Columbia No. 1.

SHOSHONE COUNTY.

C. B. Wallace's tunnel on the Ruth at Wallace is in 110 feet, showing mineral the full length.

The suit of P. Bernier and associates against T. Anderson for a portion of the Sixteen to One claim, near Wardner, has been decided in favor of Bernier, who had located the conflicting Okanogan claim. Bernier says the ground is worth \$250,000.

The Evolution M. Co., S. V. Osborne manager, has been organized to mine at Osborne.

The lead and silver output of the Cœur d'Alenes, Idaho, is to be restricted, with intent to sustain the market. The smelters have 50,000 tons of reserve, twice as much as ordinary. The reduction will amount to 25%.

MONTANA.

The 1900 (XI annual) report of the Bald Butte M. Co., B. H. Tatem, secretary and manager, states: Mine development during year: Shafts, tunnels, levels and crosscuts, 1937 feet; winzes, upraises, etc., 588 feet; cost, \$18,806.72; average, \$7.17 per foot, including grading and track laying. Extracted and trammed to mill, 26,439 tons of ore, cost \$48,579.75, average \$1.83½ per ton mining cost. Mill operation: Forty stamps dropping for 324½ days, of 24 hours each, crushing 26,710 tons; average 82½ tons daily; cost \$21,633.34; average nearly 81 cents. Average cost of milling itemized:

Labor	\$.53
Wood	.17
Supplies	.11

Comparative cost of milling in 10-stamp mill and 20-stamp mill in 1892:

	10 Stamps.	20 Stamps.
Labor	\$2 43	\$1 06½
Wood	76	28
Supplies	32	18½

Totals

The present cost with forty stamps shows less than 23½% of cost with ten stamps, and less than 53% of cost with twenty stamps. The ore yielded bullion net value \$288,289.88, average \$10.79 per ton. In addition it yielded 298 tons of dry concentrates; net cash value, \$20,-

466.16; average, \$68.68 per ton of concentrates, or 764 cents per ton of ore. Total net yield per ton of ore is \$11.45½. Gross value of bullion and concentrates produced, \$315,427.60; average, \$11.81 per ton; average of all tailings assays, \$2.0542. Net profit earned during the year, \$195,049.22, being 78% on the capital stock. The cost of all equipment at mine and mill to January 1, 1901, amounts to \$110,663.89. The amount expended for development work is \$137,466.74, all paid from profits of working. At above date it amounted to 16,288 feet of mine openings of every description.

DALY COUNTY.

The Butte Land & Investment Co. have enjoined several lode claimants to prevent the working by them on the Butte & Boston placer mine at Butte. The latter is a patented claim and the lode claimants located subsequent to the issuance of the patent. The ground has become valuable through recent discoveries of high-grade copper ore close to the surface.

JEFFERSON COUNTY.

Smelter returns from six and one-half tons of ore from the Last Chance, A. M. Easterly owner, Radersburg, netted \$1250. Considerable work is to be done this season.

LEWIS AND CLARKE COUNTY.

The Imperial Montana C. M., S. & W. Co. is incorporated in Arizona to operate nineteen mineral claims and water rights on the Blackfoot ceded strip; O. M. Holmes, agent, Helena.

London advises say that at a recent meeting of the Montana M. Co., owning the Drum Lummon, \$200,000 were appropriated for the purchase of adjoining mining property.

The 90-foot extension of the shaft on the Sallie Bell mine at Rimini is completed and drifting begun. The drift has advanced 50 feet and is expected to cut the ore body at 125 feet.

The Argo G. & C. M. Co. have started work on their tunnel near Helena and expect to cut the shoot of the upper tunnel at 200 feet.

MADISON COUNTY.

E. L. Ballou, Supt. Garnet mine and mill at Pony, is preparing to start up the property. Several hundred tons of ore are ready for crushing. Last summer a shaft was sunk to 400 feet. Some fine ore was found and stoping will commence on this. The company intend to put in a pump and do considerable sinking this summer.

MEAGHER COUNTY.

Copperopolis has a population of 300 people and the mines are producing. The North Pacific is down 500 feet and rich ore is being hoisted. The Darling Fraction is 300 feet deep and the ore bodies are from 6 to 10 feet in width. Nearly \$200,000 is said to have been taken out of these mines in 1900.

PARK COUNTY.

A. D. McNulty, manager of the Natural Bridge G. M. & M. Co., Livingston, says they are building a 15-stamp mill, which will be completed and operating within sixty days.

MICHIGAN.

HOUGHTON COUNTY.

The superintendent's report of the Franklin Copper M. Co. for 1900 shows the cost of mining and hoisting to be \$1.16 per ton; cost of stamping, 30.34 cents per ton; average cost of drifting, \$7.91; of crosscutting, \$7.87 per foot.

NEVADA.

WASHOE COUNTY.

C. Bell, Reno, claims to have struck rich horn silver in his claim in Wedekind district.

WHITE PINE COUNTY.

Lain, Minoletti & Co. say they have made a strike of rich silver-bearing lead ore in the Ne Plus Ultra at Hamilton.

NEW MEXICO.

DONA ANA COUNTY.

The Torpedo mine, in the Organ mountains, east of Las Cruces, shipped twelve cars of ore in December, eleven in January and seven in February. The ores are copper and lead carbonates.

Las Cruces, April 6.

GRANT COUNTY.

The Silver City Reduction Works, E. Hanna manager, is remodeling and adding to its plant. The new matte furnace is now in blast.

SOCORRO COUNTY.

H. C. McCreery, of the Silver Bar Copper M. Co. at Cooney, states that the mine is opened to a depth of 500 feet, and is showing a large amount of ore.

OREGON.

BAKER COUNTY.

The Bonanza mine will put in five new

concentrators right away. The Mammoth mine will put in twenty stamps.

Sumpter, April 4.

W. A. Settle and J. L. Baisley, Baker City, say they have found chrome iron deposits carrying large gold values in the Pleasant Valley district.

It is said the March cleanup of the Bonanza, at Sumpter, was \$100,000.

Potter & Fryer, Sumpter, have a tunnel in 120 feet on a big ledge of free milling ore. They report good values.

The Aurora G. M. Co., G. W. McCoy, manager, are building a cyanide plant at Baker City and propose adding five stamps to their mill. Besides treating the ore from the Perry mine they intend doing custom work.

W. H. Remington and associates, it is reported, will erect a mill of large capacity on their properties at Sumpter.

The Oro Fino mine, near Alamo, is reported sold to Spokane people.

JOSEPHINE COUNTY.

The Klondike quartz mine, Grants Pass, has been bought by D. S. Rae of Montana, who will equip and operate the property. The Klondike is claimed to have ore 10 feet wide and milling \$12 a ton.

Reports from Williams creek say a rich strike has been made at the Oregon Bonanza, at a depth of 200 feet, giving values of \$70 to \$80 per ton in gold and 7% to 10% copper.

LINN COUNTY.

At the annual meeting of the Calapoolia & Blue River M. & M. Co., at Brownsville, the officers elected were: President, J. F. Venner; secretary, C. E. Stanard; superintendent, N. B. Standish. The company owns claims in the Blue River district and proposes to erect a 10-stamp mill this season.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Homestake Co. mill has 720 stamps, the Caledonia and Father DeSmet add 200 stamps, making 920 stamps, increasing the milling capacity of the combined plants of Lead, Terraville and Central to nearly 4000 tons daily. Two new companies, the Hidden Fortune and Crosby-Ehrich, are starting the development of adjoining properties.

UTAH.

JUAB COUNTY.

J. Knight, manager of the Anaconda at Tintic, says that 35 feet below the main tunnel level they have 2 feet of ore which yields 60% lead, 130 ounces silver and \$4 in gold.

It is said that A. E. Snow of Salt Lake City, with Eastern associates, has control of the Pic Nic M. Co.'s holdings at Silver City, and that active development will begin in a short time. The property of the Pic Nic Co. adjoins that of the South Swansea and Silver Park.

PIUTE COUNTY.

The Copper Belt M. Co. has incorporated at Salt Lake City to work in Piute county. F. T. Talton is president, Max Krotki secretary and treasurer.

SALT LAKE COUNTY.

The Mystic Shrine Co. at Bingham have found 30 inches width of galena ore in the West Navajo tunnel. Manager Young says the ore will go as much as 38.6% lead, eleven ounces silver and \$8.20 in gold.

A Salt Lake City syndicate is proposing to build a tramway from Bingham to the smelting plants. The shipments at the present time are over 1000 tons.

O. P. Posey, manager of the Bingham C. & G. M. Co. at Bingham, states that the options of that company on the Mammoth and Grand Central mines will be taken up and that preparations are being made for a monthly output from the combined properties of 25,000 tons. Two more furnaces and a converter are to be added to the plant to make the product copper bullion instead of matte.

The Old Bullion M. Co. has incorporated at Salt Lake City. James A. Brown is secretary. The company owns the Sandwich and Parrot and a lease on Bullion No. 3 mining claim, in Rush valley.

The Bingham C. & G. M. Co. have arranged to have their mattes reduced to bullion at the converter of the Highland Boy M. Co., pending the completion of their own converter plant.

The Tintic M. & D. Co. have bought the Yampa group at Bingham, paying \$180,000.—Supt. Guenther reports that the Yankee Con. G. M. Co. at Eureka has struck ore 90 feet above the tunnel.

SANPETE COUNTY.

The Viking M. Co. has incorporated at Salt Lake City, W. T. Gunter secretary and treasurer.

UTAH COUNTY.

At the annual meeting of the Gold Hill M. Co., Provo, the directors organized as

follows: President, J. M. Brown; vice-president, R. R. Irvine; superintendent, F. M. Millett. The company owns properties at Stateline, on which work will be vigorously pushed this season.

WASHINGTON.

FERRY COUNTY.

The Wauconda ledge has been cut in the tunnel, 575 feet in; and 10 feet of ore averaging \$15 per ton is claimed.

The Manila, at Keller, is to prospect with a diamond drill. The drift from the lower tunnel in 70 feet shows 20 feet of ore.

The Congress M. Co. are working several nickel-bearing claims on the south half of the Colville. They are running tunnel No. 4 to get 300 feet depth on the lode, and propose to get a treatment plant to handle the ore at the mine. L. H. Hopkins, Spokane, is secretary and F. Hines superintendent.

KING COUNTY.

The Renton coal mines, near Seattle, have been bought by the Seattle Electric Co. for \$134,000.

STEVENS COUNTY.

Three feet of chalcopryite ore has been uncovered at the Grace claim, at Chewelah.

FOREIGN.

BRITISH COLUMBIA.

The Red Line group, in Windemere district, have been sold to New York people, who will open them up; T. Starbird, Fort Steele, is manager.

The poor transportation is stated by the management to be delaying construction of the 10-stamp mill at the May & Jennie group, near Nelson, under bonds to the United Gold Fields, a French company; J. J. Fleutot, manager.

J. DeLamar has bought for a French syndicate Boulder creek claims at Atlin, and will increase the present hydraulic plant.

The B. C. Ex. Syndicate has made another payment on the Iron Mask, at Kamloops. Under the management of Capt. Argall, development work is being done, the main shaft being down 200 feet.

Two ledges—one concentrating ore, the other solid galena—have been found on the Aurora mine, across Moyie Lake. It is thought the St. Eugene lead extends across the lake and into the Aurora. The strike is regarded as important.

W. W. Warner, M. E., has leased the Wonderful, in Sandon camp, and will develop it.

The Waterloo, at Camp McKinney, has started up its 5-stamp mill.

S. F. Griswold reports that the shaft of the Norway Mountain M. Co., on Norway mountain, Rossland, is down 60 feet. There is ore in the shaft that carries gold, silver, copper and lead.

Pine and Spruce creek placers at Atlin include ancient pre-glacial river beds and rich glacial moraines reconstituted into existing stream beds. The latter are formed from the glacial erosion of the old stream beds higher up stream. In drift diggings an average of \$6 a cubic yard is obtained.—The Sunrise Hydraulic Co., Atlin, J. M. Ruffner manager, will enlarge their ditches, add pipe lines and generally develop the Sunrise group, preparatory to hydraulicking next season.

W. Planta, Nanaimo, is reported to have discovered a free milling gold quartz vein on Texada island, near Texada lake.

The White Mountain M. Co. has incorporated, capital \$100,000, to mine White Mountain mineral claims in Brown's camp, in the Grand Forks division of Yale district.

It is reported that work will be resumed by the Cottonwood Alluvial G. M. Co. on Long Bar, at Quesnell.

McVicar & Lake have eight men on the Bondholder, at Slocan. A stope is being run to surface from main drift. Ore is being sorted and sacked daily.

The Silver Crown Con. M. Co. is resuming work on the Shiloh at Ymir. Tenders are asked for driving the tunnel heading 100 feet farther.

The force at work on the Foghorn mine at Ymir is to be increased and three shifts started sinking on main ore shoot.

The Canadian Gold Fields Co. believe they have made a strike on the True Blue group on Kelso creek, near Nelson. The crosscut broke into ore going 12% copper.

The LeRoi, War Eagle and Center Star at Rossland are considering the bringing in of water and the erection of two large concentrators. It is estimated that \$150,000 will have to be expended on the water line and more on the concentrators. It is claimed that with the concentrators \$4 ore can be made profitable, three to ten tons being concentrated into one at a cost of 60 cents per ton.—In the Green Mountain the diamond drill at a depth of 165 feet has cut a 20-foot ledge carrying ore of a pay grade. A shaft is to be sunk to it.—The Rossland output for the last week

in March was 8478 tons, and the total for the quarter is 95,559 tons. It is claimed the concentrator plant proposed would double this rate of output.

The Fisher Maiden, Slocan, has been bonded by the Bank of Montreal to a Spokane syndicate; J. K. Clark, manager. Work is to be commenced upon the property at once.

The Condor group, Slocan, a silver-lead proposition, bought by W. H. Sandiford for an English syndicate, will be developed this season.

The Imperial Dev. Syn., a Nelson corporation, announces the second payment on the Eva group, in the Lardo country.

DUTCH GUIANA.

J. Keegan, a former resident of Telluride, Colo., has been engaged in mining in Dutch Guiana, South America, for several years. He gives much interesting information regarding the industry as followed there. The country is not over-run with people, and vast opportunities await the energetic American who can obtain a concession, and with modern appliances engage in the mining business. There are now comparatively few Americans, and most of those who have been there some time have secured possession of valuable mineral land and are doing well. The mining field is mostly placer ground, though some promising leads have been uncovered. Placer ground is the more available, the country being comparatively flat, and along the creek bottoms and river beds fine streaks of rich gold-bearing sand are frequently found, from which, with crude processes, excellent profits are being earned by individuals and companies. Within a year or two operators have been reaching out for improved American mining machinery, and one or two modern plants were being installed. One trouble experienced in mining is in securing labor, as the natives abhor work, and the few induced to will do so no longer than is necessary to earn \$1.25, which amount seems to represent the summit of their desires. And it is with difficulty that an American can accclimate himself, for with fevers and tropical heat, the system is reduced. The average American can get along in the country, as nearly everyone speaks English.

MEXICO.

At Tepic the Zopilote M. Co. is working the Zopilote, Frizada, Javalina and Restauradora mines. The net yield in 1900 was \$119,331.84, Mexican—the Restauradora mine \$9256.69, Mexican. The manager says there are thirty stamps in operation. The lixiviation process operates successfully.

At Ixtlan del Rio the Castellana M. Co. say an English company will buy the property and increase considerably the development.

Tepic, March 26.

The Guadalupe and Fortuna mines, La Cumbre, Guadalupe y Calvo, State of Chihuahua, have been sold to New York men, upon a report made by W. H. Weed, Butte, Montana. The vein is said to average 10 feet of pay ore, free gold and pyrites.

The British G. M. Co. have erected a smelter at La Colorada, Sonora, having a capacity of 600 tons. A. L. Waters is manager.

Cameron, Currie & Co. of Detroit, Mich., have bought the Garcia mines in Oaxaca, and propose putting a large machinery plant on them.

SOUTH AFRICA.

Sinking and crushing have started in the Simmer & Jack, Jubilee, City & Suburban and Salisbury properties, on the Rand.

SOUTH AMERICA.

Colon reports 200 bars of gold are on the way north from the interior of Colombia. Nearly \$1,000,000 left Colon on the 24th for Europe on the Para for Southampton.

SPAIN.

The Rio Tinto copper mines during 1900 yielded 1,894,504 tons of pyrites, compared with 1,649,844 tons in 1899. The average of copper content was 2.774%, as compared with 2.719%. Copper produced, 35,732 tons.

PERU.

A Government engineer, measuring a rubber concession in the lower part of the San Gabanes river, in Carabaya, has discovered placer gold.

Trade Treatises.

General Catalogue No. 22 of the Smith-Vaille Co. sumptuously sets forth the latest as produced by them in all departments of pumping machinery, handsomely illustrated and full of detailed information on that entire subject. A copy of this fine publication will be sent upon request. Issued by the Stilwell-Bierce & Smith-Vaille Co., Dayton, Ohio.

Personal.

JNO. FILIUS has returned from Boston to Redding, Cal.

W. C. RALSTON will be in New York City till June 1st.

J. B. STEVEN is in Grass Valley, Cal., examining mines.

R. G. LEGG is now Supt. Shawmut mine, Bingham, Utah.

PHILLIP DEIBESHEIMER is examining copper mines in Mexico.

H. E. LIGHTNER of Amador county, Cal., is in San Francisco.

I. MAY has been appointed Supt. Triumph mine, Victor, Colo.

WM. FITZMAURICE is with the Trinity Copper Co. at Copley, Cal.

E. A. WILTSEE is at Eureka, Utah, examining mines at that place.

L. F. WARNER, mining engineer of Auburn, Cal., is in San Francisco.

A. M. GAINES has been appointed manager Rialto M. Co., Leadville, Colo.

PROF. N. H. WINCHELL, State Geologist of Minnesota, is in Helena, Mont.

H. L. JOHNSTON has been appointed Supt. Oriental mine at Alleghany, Cal.

H. M. CHANCE, M. E., of Philadelphia, Pa., has returned home from Globe, Ariz.

C. W. PURRINGTON of Boston, Mass., is examining mines in Siskiyou county, Cal.

A. GRAVES, M. E., of Denver, Colo., is in Arizona examining mines near Prescott.

H. D. LANE of Cripple Creek, Colo., is Supt. White Hills mines, near Kingman, Ariz.

C. A. HOLLAND, Supt. Providence mine, Tuolumne Co., Cal., is in San Francisco.

JOHN OWEN, manager of the John Owen M. & M. Co. of Colorado, has resigned.

CAPT. H. H. TODD of Alameda, Cal., is now resident manager New York Exploration Co.

J. P. EVANS of the Colorado Iron Works returns from Detroit, Mich., to Denver next week.

J. E. SPURR of the U. S. Geological Survey has gone to Turkey to examine mines for the Sultan.

T. E. SCHWARTZ, manager Iron-Silver M. Co., Leadville, Colo., has returned there from New York.

W. W. ADAMS of Butte, Mont., is at Redding, Cal., in charge of the works of the Trinity Copper Co.

P. B. ETESON, Supt. Kia Oro gold dredger, Oroville, Cal., returns there from San Francisco this week.

P. J. DONAHUE, who has been examining mines at Eureka, Nev., has returned to Salt Lake City, Utah.

B. J. LOTT of Helena, Mont., has been appointed manager Blackfoot Copper Co., operating near that place.

W. H. SULLIVAN, representing the Mine and Smelter Supply Co. of Denver, Colo., has returned from Arizona.

L. VON ROSENBERG, who has been examining the Vulture mine, at Wickenburg, Ariz., has returned to New York.

A. C. SIEBOTH of Denver, Colo., and G. A. LOUDBERY of Milwaukee, Wis., are examining mines near Globe, Ariz.

T. C. CASSIDY of Kalgoorlie and L. N. WALFORD of Sydney, Australia, mining engineers, are at Cripple Creek, Colo.

THOS. J. BARBOUR of the Risdon Iron Works, San Francisco, returns to San Francisco from Nova Scotia next week.

A. M. JAINES, manager Home Ex. M. Co., Leadville, Colo., is to have the same position with the Rio Alto M. Co., at the same place.

FRANK W. GRIFFIN, representing the Bucyrus Co., has returned from South Milwaukee, Wis., to San Francisco. His office is 507, Safe Deposit building.

Obituary.

MR. WM. H. BIRCH, prominent for many years in the manufacture of mining machinery, died at his residence at Haywards, Cal., on the 9th inst. Deceased was a native of Boston, Mass., in the 70th year of his age, and during the course of a long and useful life did much for the State of his adoption.

RICHARD C. CHAMBERS, a well-known California and Utah miner, died in San Francisco on the 11th inst., in the 65th year of his age. For forty-five years he was a prominent figure in Western mining interests, and at the time of his death was superintendent and part owner of the Ontario, Utah, mine.

JNO. F. KIDDER, California State Debris Commissioner, and a foremost citizen of Nevada county, Cal., died at Grass Valley,

Cal., on the 10th inst. He was born in New York City in 1830, and for fifty years was prominent in railway affairs. He was for twenty-five years the leader in the maintenance of the Nevada County Narrow Gauge Ry. Co., and did much for the development of the mining industry of Nevada county.

Parrot S. & C. Co., regular quarterly \$1.50 per share.....	April 29
Creede & Cripple Creek M. & M. Co., Colorado, 2 cents per share, \$16,000.....	May 1
Anaconda, Montana, regular \$1.25 per share, extra 75 cents per share, \$2,400,000.....	April 26

Commercial Paragraphs.

C. M. HAMPSON, Denver, Colo., recently installed four Bartlett tables in the mill of the California & Colorado Shareholding Co., Idaho Springs, and two of the same make in the Cold Springs mill at Rowena, Boulder county, Colorado. The Bartlett tables are manufactured by the Colorado Iron Works.

THE Pacific Iron Works of McKittrick, Cal., has a new 800-pound American steam hammer from John Wigmore & Sons Co., Los Angeles, Cal. John Wigmore & Sons Co. have also sold a heavy lathe to the Valley Machine Shop of Fresno, Cal., and another to the Hanford, Cal., Agricultural Works.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO.,
PIONEER PATENT SOLICITORS
FOR PACIFIC COAST.

FOR WEEK ENDING APRIL 2, 1901.

- 671,043.—GRAIN SEPARATOR—D. Best, San Leandro, Cal.
- 671,044.—AIR COMPRESSOR—G. S. Binckley, S. F.
- 671,178.—FRUIT CAR—Bollinger & Drago, Reedley, Cal.
- 671,366.—PIPE COUPLING—G. M. Brodie, Angels, Cal.
- 671,078.—DISTILLATION—J. T. Davis, S. F.
- 671,209.—AIR PUMP—R. W. Elliott, Oakley, Cal.
- 671,047.—HAIR BRUSH—H. H. Fox, Spokane, Wash.
- 671,164.—BRAKE—E. M. Fraser, S. F.
- 671,081.—GELATINE DYNAMITE—E. E. Green, Santa Clara, Cal.
- 671,068.—BED BOTTOM—Jno. Hoey, S. F.
- 671,051.—SPECTACLES—W. C. Jones, S. F.
- 671,085.—HARVESTER SICKLE—P. W. Knowles, Dufur, Or.
- 671,024.—MOWER—V. J. Long, Sprague, Wash.
- 671,112.—VEHICLE AXLE—P. B. Mathiason, Los Angeles, Cal.
- 671,421.—FISH DRESSING MACHINE—G. Merkle, S. F.
- 671,088.—PROPELLER—J. S. Morton, Oakland, Cal.
- 671,089.—PROPELLER—J. S. Morton, Oakland, Cal.
- 671,090.—PUMP—J. S. Morton, Oakland, Cal.
- 671,222.—TRUCK—J. J. Moule, Stockton, Cal.
- 671,027.—ROLLER CHAIR—A. J. Petter, S. F.
- 671,028.—PULP AGITATOR—J. R. Phillips, Stockton, Cal.
- 671,388.—PROTECTING SAFES—A. P. Prichard, Tacoma, Wash.
- 671,298.—GARMENT FASTENER—W. T. Schmidt, Blanco, Cal.
- 671,095.—RICE PREPARATION—M. Shino, S. F.
- 671,073.—MECHANICAL STOKER—W. H. Smyth, Berkeley, Cal.
- 671,096.—BASIN MAKER—C. J. Stoneham, Sierra Madre, Cal.
- 671,074.—HITCH BLOCK—M. C. White, Los Angeles, Cal.
- 671,075.—PHOTO PRINT WASHER—T. White, Vallejo, Cal.
- 34,317.—DESIGN—A. Heunisch, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Doney, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HAIR AND SCALP BRUSH.—No. 671,047. April 2, 1901. H. H. Fox, Spokane, Wash.

This invention relates to a brush designed as a means for applying a tonic or shampoo liquid to the scalp and the hair, and consists of a rubber bulb carried upon the handle and holder, teeth projecting upon the opposite side having connection with the interior of the bulb whereby a liquid contained therein may be applied to the scalp, and proper friction maintained on the same.

BED BOTTOM ATTACHMENT.—No. 671,068. April 3, 1901. John Hoey, San Francisco, Cal.

The object of this invention is to provide a finish for the ends of the transverse frames of bed bottoms, to provide a means for supporting the bottom from the side rails of the bedstead so as to hold the wire bottom at the proper elevation, at the same time to allow the side rails of its frame to hang unsupported inside the bedstead rails. It also provides a means for stiffening and retaining the top mattress in place, and for securing the spiral springs beneath the woven wire bottom, so that they will remain in an upright position and not slip out of place.

PULP AGITATOR.—No. 671,028. April 3, 1901. John R. Phillips, San Francisco, Cal.

This invention is designed for use in the working of pulp or tailings containing metals or the like. It consists of an inclined funnel-shaped tank, a circulating or suction and force pump, a pipe extending centrally down to near the bottom of the cone with a discharge nozzle through which the liquid is delivered when forced so as to flow upward along the sides of the funnel and through the material whereby the latter is loosened, agitated and prevented from packing. A filter lining may be used for the funnel provid-

ing a space intermediate between it and the sides of the funnel for the filtering through of water, and a means for conducting such filtered water away from the apparatus.

GRAIN SEPARATOR AND CLEANER.—No. 671,043. April 3, 1901. Daniel Best, San Leandro, Cal.

This invention relates to an apparatus for separating grain from chaff and foul material with which it may be associated after threshing, and for cleaning it. It consists in the combination with a threshing cylinder, inclined grain carrier, and separate straw carrier of a stationary horizontally disposed screen located below, an endless traveling belt with transverse slats moving over the upper surface of the screen, and fans located beneath and discharging an air blast upwardly and rearwardly through the screen.

Latest Market Reports.

SAN FRANCISCO, April 11, 1901.

SILVER.—Per oz., Troy: London, 26.3d (standard ounce, 925 fine); New York, bar silver, 59c (1000 fine); San Francisco, 59c; Mexican dollars, 49c San Francisco, 48c New York.

The establishment of a mint in Manila, P. I., as at present contemplated by the United States Government, would aid in keeping up the price of silver. This subject is treated at some length editorially on page 176.

COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$17.00; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.50; Casting, 1 to 3 casks, \$16.75; carload lots, 16.62c. San Francisco: 18. Mill copper plates, 20c; bars, 22c@23c. London: £68 12s 6d per ton.

LEAD.—New York, \$4.37; Salt Lake City, \$4.00; St. Louis, \$4.27; San Francisco \$5.00, carload lots; 5c 1000 to 4000 lbs.; pipe 6, sheet 7, bar 6c; pig, \$4.70 @5.10. London, £12 6s per ton=2.75 cents per lb.

Denver this week reports that the manager of the smelter trust there announces that the selling price for lead has been reduced from \$4 to \$3.90, and mine operators look for a still further reduction.

The \$4 rate has been in effect now over a year. The mine owners entered into an agreement with the trust to accept the \$4 rate regardless of the market price of lead, which at that time was above \$4. The agreement expired January 1st, and the trust now asserts that, on account of overproduction, it is unable to maintain the \$4 rate.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 10s per ton =3.58 cts. per lb.; San Francisco, ton lots, 54c; 100-lb lots, 6c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 100-lb lots, 12c; 300 to 500 lbs., 13c@14c; 100-lb lots, 15c@18c.

IRON.—Pittsburg, Bessemer pig, \$17.25; gray forge, \$16.50; San Francisco, bar, per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$27.00; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, \$26.00; San Francisco, ton lots, 29c; 1000 lbs., 29c; 500 lbs., 29c; less, 30c; bar tin, 3c.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 7 1/2 lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5c; slab, 5 1/2c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15c.

ASSAY LITHARGE.—San Francisco, 10c per lb. small lots.

BISMUTH.—New York, 3c per lb., \$2.25 50-lb lots; San Francisco, \$2.50 to \$2.75 per lb.

PLATINUM.—San Francisco, crude, \$18 per oz.; New York, \$18.20 per Troy oz. **ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$62.50, large lots.

TUNGSTEN.—New York, 3c per lb., 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

NICKEL.—New York, 50c@60c per lb.

PHOSPHORUS.—F. o. b. New York 50c@60c per lb.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15c; less than one ton, 17c. No. 1*, 60%, carload lots, 13c; less than one ton, 15c. No. 1** 50%, carload lots, 11c; less than one ton, 13c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9c; less than one ton, 11c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c per set; 14 oz., 40s., 9c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 32c@33c per lb.; carloads, 30c@31c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$1.90 per 100 lbs. 58%; hyposulphite of soda, 24c@3c per lb.; blue vitriol, 5c@6c per lb.; borax, concentrated, 7c@8c per lb.; chlorate of potash, 12c@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2c@2 1/2c; California refined, 1c@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3c@4c per lb.; Cal. s. soda, bbls., \$1.00; ska, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, pure, boiled, bbl., 75c; cs., 80c; raw, bbl., 73c; cs., 78c. Deodorized Stove Gasoline, bulk, 14c; do., cs., 20c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's' bbls., 60c; cs., 65c; No. 1 bbl., 50c@52c; cs., 55c@57c.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

SITUATIONS WANTED.

First-Class Amalgamator

Wants position to take charge of Quartz Mill. Years of experience and best of references. Address H. T., this office.

ASSAYER AND CHEMIST, who understands surveying, desires position with some large mining company. Long experience in a Spanish-speaking country. Thorough knowledge of Spanish. Will start with a small salary where there is a chance for promotion. Address G. F., care of this office.

A Mining Engineer with many years' experience as manager of large properties in the United States and Mexico, is open to an engagement as manager or superintendent. Possesses both executive and managerial ability and can furnish the best of testimonials. Address Box 29, care of this office.

Engineers, Firemen, Machinists, Electricians: Send 10 cents for new 40-page pamphlet, containing list of questions asked by examining Board of Engineers. GEO. A. ZELLER, Publisher, St. Louis, Mo.

WANTED.

Superintendent Wanted.

A young man competent to make surveys, supervise small mill, direct timbering, etc. State experience, reference, age, general particulars, and salary expected. Address "Volcanic," this office.

Wanted—Rand Drill Man.

Must be capable of running compressor. State experience and wages required. One acquainted with Mexico and language preferred. Address DRILL, care of Mining and Scientific Press.

Wanted, by May 1st, two first-class amalgamators to run a 10-stamp mill; one must be a machinist. Only first-class men with reliable reference need apply. Wages satisfactory to the right men. Camp 35 miles from Roseland and 7 from railroad. Good accommodations. New mill and steady work. Reference: Bank of British North America, Roseland. Address T. JAMES, Supt. Onondaga Mines, Roseland, B. C.

ACUITAPILCO DISTRICT!

Wanted, partner with \$10,000 gold for development; can get half interest in gold, silver and lead mines (five). Plenty of concentrating ore averaging 25 ozs. silver to the ton of 2000 lbs.; gold, $\frac{1}{4}$ oz. Water power and timber close to the mines. LIC. ELIAS GALINDO, P. O. Box 26, Tepic, Mexico.

Bond and Lease Offered.

Will give bond and lease on the Franklin & Union group of two patented claims on Turkey creek, Bradshaw mountains, 20 miles south of Prescott, Arizona. Has 600 feet development work, showing good body of high grade silver ore. Correspondence solicited.

P. P. BUSH, 1607-17th St., Denver, Colo.

BRITISH COLUMBIA MINES.

Gold, Silver-Lead and Copper Properties. Excellent chance for profitable investments in legitimate mining in BRITISH COLUMBIA. Capital needed for developing promising prospects. A specialty made of FREE MILLING GOLD properties. Very promising FREE MILLING GOLD properties for sale, terms reasonable. Mines examined and reported on by reliable mining engineers. Correspondence solicited. Address Andrew F. Rosenberger, P. O. Box 700, Nelson, B. C.

FOR SALE.
A
20-Stamp Mill.

Strictly Modern.

Little Used.

Built by Fraser & Chalmers.

ANY PART OF THIS MILL WILL BE SOLD.

This 20-stamp mill is located at Ohio City, about 25 miles east of Gunnison, Colorado. We are dismantling this mill for shipment to Denver and will quote prices on any part of the mill f. o. b. cars Ohio City, Colorado, and guarantee to make prompt shipment. The construction of the mill was of the best, both in machinery and buildings. The total cost of machinery and buildings, which we have bought, was \$130,000.00. Why was it sold? Simply another case of a mill without a mine. All correspondence should be addressed to our Denver office.

20 STAMPS. 850-lb. rapid drop, complete with frames.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

For Prospecting Purposes
or Underground Work,

USING COMPRESSED AIR.

HOIST FOR PROSPECTING.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

A STRONG ROOFING ==

P. & B. Ready Roofing is ten times stronger than paper, felt or any other kind of ready roofing manufactured—cannot be torn; is absolutely odorless, a quality which no other roofing possesses.

It is fire resistant—fire will not run on it and insurance companies assume the same risk on buildings covered with P. & B. Ready Roofing as with tin and slate. It is a non-conductor of heat and as such renders a house cooler in summer and warmer in winter, and this latter quality has made it invaluable for refrigerating and cold storage warehouses, cars and ships. It is the most durable and lasting roofing invented and requires but slight care after being once properly laid.

The laying of it is so simple that any person can complete from 6 to 10 squares a day, thus making a large saving in labor cost. It is used successfully and easily over worn-out shingle or tin roofs.

For roofing large surfaces P. & B. Ready Roofing is especially adapted, as it does not require a heavy truss system to support it.

Comes in rolls—is easily and cheaply transported.

100 POUNDS OF ORE SAMPLED IN 10 MINUTES.

Calkins' Umpire Ore Sampler.

An accurate, quick and absolutely impartial machine for sampling ore in quantities of from

one to one hundred pounds. Easily operated and cleaned.

No danger of salting subsequent samples. Makes the

operation of sampling an easy one; and all competent

assayers know that to obtain an assay sample by hand

requires more trouble and time than is necessary to re-

duce the resultant sample to the pulp. Diagonally opposite portions are

taken each time; and assay samples are obtained with this machine in less time and with

less trouble than by any other method.

DENVER, COLO., U. S. A.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilean Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

Read what MR. O. NEWHOUSE, Consulting Engineer of the S. F. & S. J. Coal Co., has to say in regard to it.

OFFICE S. F. & S. J. COAL CO., TESLA, ALAMEDA CO., CAL., July 13, 1900.

Mr. A. T. Ames, Galt, Cal.—DEAR SIR: Replying to your favor of recent date regarding the working of the Fulton Pump bought of you will say: The pump is one of your 30 H. P. model in connection with a Fulton Double X double plunger cylinder 5 in diameter by 10 in long stroke of 4 in plunger 2 ft. This pump is installed in our mine on the 600 ft level directly over our pump and is forcing the water to the surface at one lift. We drive the pump with an electric motor 30 H. P. direct connected to the pump with gear and pulley, and I am pleased to submit the following statement of duty:

Length of 6 in column leading up incline to surface.....	805 ft.	Strokes double per minute.....	25
Perpendicular head.....	640.88	Discharge measured by box center thereof, under 5 in head equal to 1 1/2 cu. ft., equal to gallons per hour.....	4755
Gauge pressure actual.....	275 lbs.	Diameter of pump cylinder.....	5 in.
" theoretical.....	275.4 "	Net area of pump cylinder after deducting area of piston.....	17.868 sq. in.
Barometer at pump.....	29.68 in.	Efficiency of pump when working under above conditions.....	84.81 per cent.
" point of discharge.....	28.95 "		
Temperature air.....	68 deg.		
" water.....	76 "		

To say that we are highly pleased with our pump expresses it very mildly

Signed, O. NEWHOUSE, Consulting Engineer S. F. & S. J. Coal Co.

Gentlemen: After giving your Cellular Asbestos Sectional Steam Pipe Covering a thorough test, we have concluded that it is the best covering that we have ever seen.

We have pipes covered with magnesia covering under the same steam pressure, and we find the temperature in them considerably higher than in your covering.

We shall certainly use your covering whenever we have any steam pipe to insulate.

Yours truly,

The Ice and Cold Storage Co. of Los Angeles.

For houses not having gas or electric light service, and for those that have, but wish economy and independence.

Costs \$4.00 Per Light
EACH LIGHT LASTS A LIFETIME

Gives a steady light, brilliant as electricity, and whiter. Exceeds any town gas service in existence. No complications; nothing to get out of order. Simple as A, B, C. Handy as a "candle" - jets can be carried around anywhere in the house. Gas cannot escape, like from the town mains. No smell, no smoke and no danger, as with kerosene or gasolene. No accident of any kind possible, and the whitest, steadiest and richest light that is known.

Write us for particulars.

DOUBLE CYLINDER SINGLE DRUM HOISTS.

The above form of Hoisting Engine has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes which assures quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

WRITE FOR SHIPPING TAGS.

WHAT THEY SAY:

Capt. C. S. Collins, 58 Broad St., N. Y., says:
"It's the best GOLD saver in the world."

Capt. H. R. Gillingham, Cld., N. C., says:
"Saves the minutest float Gold, and after two years' use am convinced it is the only machine that will save float Gold."

Sam Keast, Supt. Buster mine, A. T., says:
"Will do perfect work and save all the Gold, fine or coarse, with proper usage. We save Gold readily that floats on water."

Earle C. Bacon, Engineer, N. Y., says: "Samples (concentrates) received and are finest work I have ever seen in that line."

Dr. Thos. H. Hicks, Expert in Gold and Silver Treatment, Ft. Wayne, Ind., says: "That little machine is a daisy. The fact that you readily save values that float on water is to me the most convincing argument against the wet system."

The Hooper Pneumatic System

Is the only reliable method of treating mixed, silty or rebellious ores. Zinc and lead combinations handled in good shape where all other processes had failed.

Brunton's Pat. Pocket Mine Transit.

1-3 ACTUAL SIZE.

The engraving herewith illustrates Brunton's
Pat. Pocket Mine Transit as it appears when
folded ready for the pocket.

The working parts are enclosed by an aluminum
case, the outside dimensions of which are but 2 3/4 x
2 3/4 x 1 inches and the total weight but 8 ounces.

There are over two hundred of the above instru-
ments in daily use at the present time, and those
using them unite in pronouncing them the most
convenient, accurate and reliable pocket instru-
ments on the market. Send for Catalogue B to

CYANIDE 98%

Manufactured by the Roessler & Hasslacher Chemical Co.,
New York, for sale in quantities to suit by

HAAS, BARUCH & CO.,

100 CALIFORNIA ST., SAN FRANCISCO, CAL.
SOLE AGENTS.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore.
OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tail-
ings, and our record of results—showing in almost every instance achievements on the large scale such
as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a
Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes;
our experts, however, are constantly devising improvements, the latest being a method of overcoming
the difficulties which have hitherto prevented the successful handling of ores containing copper and
also a method for the profitable handling of silver ores by cyanide.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced
first-class agency. We have able and trustworthy associates and agents in Washington and the capi-
tal cities of the principal nations of the world. In connection with our scientific and Patent Law Li-
brary, and record of original cases in our office, we have other advantages far beyond those which can
be offered home inventors by other agencies. The information accumulated through long and careful
practice before the Office, and the frequent examination of patents already granted, for the purpose of
determining the patentability of inventions brought before us, enables us to give advice which will
save inventors the expense of applying for patents upon inventions which are not new. Circulars and
advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market
St., San Francisco, Cal.

ROBINS CONVEYING BELT CO. Park Row Building, NEW YORK.

THE SNODGRASS HAND POWER COMMON SENSE PULVERIZER & CONCENTRATOR.

This Hand Power Machine is built on the same general principle as the regular machines, only being smaller in size and capacity. While this is intended to be run by hand power, it can easily be changed for steam or gasoline by simply putting on the pulley in place of the gearing. This has a capacity of 1 1/2 to 2 tons per hour. This is just the machine for working at Cape Nome and other places where it is difficult to procure wood, coal, or gasoline for power. It requires but a small amount of water, and a pump can be attached, so that one person can pump the water as well as run the machine. It can easily be moved from place to place, as the heaviest part only weighs about 250 lbs., the total weight being about 500 lbs.

Address S. K. SNODGRASS, DENVER, COLO. (The Windsor.)

ASSESSMENT NOTICES.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Placerville, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of March, 1901, an assessment (No. 10) of two cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of April, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 15th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
N. F. REMINGTON, Secretary.
Office—112 Main street, San Francisco, California.

SOUTH SLIGER GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Spanish Dry Diggins Mining District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of March, 1901, an assessment (No. 1) of two cents per share was levied upon all the issued or subscribed for capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 402 Front street, Room 8, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. L. DANIELS, Secretary.
Office—402 Front street, Room 8, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Contra Costa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of March, 1901, an assessment (No. 3) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 323 Parrott building, 825 Market St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of April, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of May, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
J. C. ANTHONY, Secretary.
Office—Room 323 Parrott building, 825 to 855 Market St., San Francisco, California.

DRY PLACER MACHINES.

THE PNEUMATIC PROSPECTOR.

Size 6x11x14 in. Weight only 10 lbs.

PACKED FOR MOVING.

NO WATER NEEDED.

Gives a clean prospect from placer ground or free-milling ore by compressed air. The operation is purely mechanical. No chemicals, no quick-silver; no black sand remains with the gold. Will do work equal to careful panning.

THE PNEUMATIC SEPARATOR.
Weight 160 lbs.

Has a capacity of 20 to 30 cu. yds. of gravel per day. Will save fine and coarse gold and nuggets of any size, comparatively free from black sand. Will do better work under favorable circumstances than a sluice box. Indispensable for dry countries.

SMOOTH-ON IRON CEMENTS

For stopping leaks and pitting in MARINE BOILERS, for boiler patching, for repairing leaks or fractures in steam or hydraulic work, and for repairing blemishes in iron or steel castings. These cements are prepared in powdered form and applied by mixing with water. When hard they will withstand a red heat, steam, water, or oil, and expand and contract the same as iron. Write for illustrated catalogue and prices. When ordering state for what use.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

Chloriding the Dumps.

It is a long time ago in the recollections of the old miners since "chloriding the dumps" was a recognized part of mining camp life in the then far West. The expression seems to have disappeared along with the other mysteries that were once to the uninitiated a cloud of romance and imagination around silver mining. It belonged to the times when a mine was a gold mine, a silver mine, a lead mine or a copper mine, the times before metallurgical science had made out of one ore deposit a mine of all of these metals.

The first silver mining in Nevada, Arizona, Utah and the West generally, was in deposits the principal mineral of which was frequently the chloride of silver. Miners were generously careless in those old days and in working out the bonanzas of the deposits many pieces of the rich chloride mineral went out of the mine with the waste into the dump. These dumps became the paradise of the camp scavengers who picked them over for the occasional rich pieces of chloride and other silver ores, their occupation quickly becoming known in characteristic mining camp vernacular as "chloriding the dumps" or simply "chloriding."

The occupation still exists, though it is no longer one of the transient recreations of mining life, a temporary resort for a miner in hard luck. It is now an important part of the legitimate business of the industry, and a particularly safe and profitable part. Waste dumps and tailing piles are now valuable assets of every old mine once even moderately rich. The picturesque chlorider and his gunnysack have evolved into great concentrating and cyanide plants, employing large capital and men of the most advanced technical skill.

Artistically the old chlorider to whom was provided the opportunity of moderate wealth without cost or risk could not be improved. Practically his successors are far more satisfactory. There are no longer dumps in the old sense—avoidable waste is avoided in the first instance, and the methods and

Casting a Large Bell.

appliances for recovering the unavoidable wastes of first operations have been so perfected that rebellious ores—sulphides that will not amalgamate—are no longer excuses for mine failure. There are marvelously perfect concentrating machinery, economical wet chemical and electrical processes, and smelters to which can be fed anything in the way of rock that contains valuable metal with the assurance that after the fiery digestion the metal will be delivered separate from the rock. If no one of these will directly accomplish the desired result, there are

other combinations of the machines and methods still available. The rare dumps which do contain pieces of mineral that can be recovered by hand picking are no longer donated to the poor and those in hard luck. They are sold to capitalists instead.

The Casting of a Large Bell.

Herewith is an illustration of the casting of a large bell. The picture was taken as the hot metal was being poured into the mold. The bell is for the United States Lighthouse establishment, and is intended for the north end of Alcatraz island, San Francisco bay. It is made of genuine bell metal, as this metal, which is composed of copper and tin, has been found to produce the clearest and longest continued vibrations of any metal known. The weight of this bell is 3300 pounds, and it was made by W. T. Garratt & Co., brass and bell founders, of San Francisco, Cal.

EVERY new mining district into which prospectors, miners and seekers of sudden wealth rush, in turn receives the condemnation of the disappointed ones. The mines do not go down—they are only surface pockets—are statements of these people, intended to discourage the work that they will not themselves do, for their disappointment has not followed failure of their mining work, but failure to do any work. The real trouble is that these miners do not "go down;" the mines may, for all they really know.

PART of the city of Butte, Mont., adjacent to Senator Clark's mine, is settling and sliding. The newspaper geologist gravely explains it by saying that the city is built on a gravel bank and that the weight of the gravel is breaking down an old volcanic cone underneath, therefore the sliding. Why not explain what the combined weight of the volcanic cone and the gravel is breaking down? Virginia City, Nevada, has had similar experiences.

The Beginning of Petroleum.

Recent explorations in sea waters have proven that light does not penetrate more than 300 feet beneath the surface. Beyond this depth marine plants dependent on light for life cannot exist. Marine animal life is known to exist in all sea depths. Excepting such areas as the Saragossa sea, where there is a vast accumulation of floating marine vegetation, the latter only lives in the shallow marginal waters next the land areas and on shallow banks. On land areas plant and animal life are coexistent everywhere.

Consider, now, the present time as part of a geological period, and that plant life and animal life in the individual, once dead, become decomposed, part of the body disappearing in the atmosphere in gases, part in fluids—including dissolved solids—disappearing ultimately in the sea water, and the third part as solids, insoluble, remaining in place. It is clear that what identity remains in that which was the individual plant or animal must reside in the solids remaining in the place of death, which for reference, conforming to common usage, are called the remains.

Animal remains of the life of yesterday and to-day are restricted to the bony parts of the individual, the parts where there is either no carbon tissue with what, for distinction, are termed inorganic or mineral substances, or only a minor portion of carbon tissue. All of the carbon of the organic or carbon tissues disappears in gases into the atmosphere or in fluids, ultimately to the sea. None of it remains with the inorganic or mineral part. A striking illustration of this is in the bodies of mammoths found frozen in the Tundra ice of northern Siberia. These preserved ages in sealed cold storage were untouched by heat which would decompose. Other individuals of the same kind, dying before the time of the ice sheet, became buried beneath stream drift before the carbon tissues could disappear, since the bony remains are now found naturally disposed. Yet, after that burial and before the coming of the cold, the carbon tissues did disappear in gases and fluids. Did they not, the same cold that preserved the bodies in the ice would have preserved the undecomposed or partly decomposed carbon tissues in the frozen ground.

Plant remains of the life of yesterday and to-day, like the animal remains, disappear in part as gases into the atmosphere, part as fluids into the sea, and part, as solids, remain in place, to more or less preserve the identity of the individual. But, in the case of the plant remains, there is in addition to the inorganic or mineral part corresponding to the bony part

of the animal, some of the carbon tissues. All of the carbon does not disappear.

The preceding has had more particularly in mind land animals and land plants as being most naturally within direct observation and knowledge. Sea animals do not leave remains in the same sense as land animals. They do not die natural deaths. Each kind of marine animal lives by consuming some other marine animal, and is itself in turn food for a succeeding marine animal. But, when rarely they do die, naturally the carbon tissues disappear absolutely, leaving only the inorganic minerals as remains. So far as is known, the death or after-death of marine plant life is exactly the same as if it were land plant life. Some of the body of the individual disappears in gases, some in fluids, and a third portion, including some of the carbon tissues, stays in the place of death.

What is true of the individual is true of the mass, which is only the sum of an indeterminate number of individuals. In certain land conditions the carbon of land plants cumulates and becomes first vegetable humus, next peat. Such accumulations of carbon of land plants made in determinable geological periods are now coal. Where the bony parts of land animals of the same determinable geological period as a particular coal are most plentiful, there is no trace of the carbon tissues; all of the carbon has disappeared.

Marine plant remains of carbon tissues, if, as this paper holds, there are such, and if accumulations are made, would accumulate in the places of growth, in lines or bands of varying width, occupying a portion of the shallow sea bottom plane inclining away from the land surface. These bands or lines next the shore would have their limiting edges in a depth of water and distance from the shore which would be without the sweep of the surf; away from the shore their edges would be the line of depth below which the influence of light does not extend and below which marine plants could not live.

Marine animal carbon remains, if there be such (this paper maintaining there are not), would have no limitation of locus to a line having a definite relation to a shore line, but would accumulate indifferently in any part of the sea's bottom.

If accumulations of marine remains, plants and animals have been made in past geological periods, these remains if preserved would exist—the plant remains in a line or band of rock roughly parallel to and following an unconformity of stratigraphy, the old seashore line, the animal remains indifferently anywhere superficially.

The preceding, indicating logically where marine plant and animal carbon remains, assuming such to exist, would accumulate and become fixed in rocks formed from sediments, the reverse reasoning, from the sediment-formed rocks, can be tested by the constructive facts. All sea-formed sediments receiving animal carbon remains evenly disposed, supposing the existence of such, then all sea-formed rocks should contain evenly disposed carbon or carbon products. Some lines of sea-formed sediments receiving plant carbon remains—assuming their existence—then some lines of sea-formed rocks should contain carbon or carbon products. And as some lines or bands of sea-formed rocks roughly parallel to an unconformity—the old shore line—are found to contain carbon and carbon products, therefore the reasonable presumption would be that marine plant remains, rather than marine animal remains, were the beginning of petroleum. The conclusion becomes more reasonable and more the result of the application of logic, on considering the chemistry of decomposition succeeding the death of the individual and preceding the comparative fixidity in rock of the remains. From the individual land plant that dies to-day there are carbon remains after the decomposition. From the individual land animal that dies to-day there are no carbon remains after decomposition. For land plants the carbon preserver is fresh water, for land animals the carbon dissipator is fresh water. There is no reason deducible from chemistry why sea water should not act substantially as fresh water does. And, assuming that it does, the carbon of marine plants would remain after decomposition, and the carbon of marine animals would not.

The identification of the carbon-bearing rocks, whether land born, as are the coal measures, or sea born, as are the petroleum sands, is conclusive. The

conditions of carbon accumulation are dissimilar. In the land plant-formed carbon deposits the accumulation was effected by successive growth and death of plants under conditions that did not normally bring any water-carried sediments to mix with the carbon. Thick deposits could be, and were, formed of practically pure carbon and carbon products. In the sea-formed carbon deposits the accumulation was under conditions which facilitated the deposit of sediments with the carbon, and under which large quantities of sediments were continually being brought to the situs of the deposit. Naturally, then, these sea born carbon deposits could not make coal beds, but could make a carboniferous shale.

The attempt here made is to fix the beginning of petroleum, to give the beginning a place, and to give it a legitimate logical parentage. The next steps—how the carbon remains became petroleum, how the petroleum came to the place where it now is, and the relation of the present habitation to the habitation before the change of state—are other problems, simpler of solution when there is a determinable beginning. The two first of the questions have been long since answered; the third all but suggests its own answer. The sea born carbon deposits have not moved far from the place they were laid down into beds—above or below some, sideways very little.

The California explorations have been the suggestion of the preceding. The petroleum-bearing rocks are younger than the petroleum rocks of other localities. They are not so covered with still younger rocks, and the unconformable contact indicative of old shore lines is clearly in evidence. The dynamical geology of the rocks, as well as their stratigraphy, has been very fully and intelligently studied. The whole is on such a grand scale that the misleading effect of complex detail is avoidable. No such conclusive study is possible in Pennsylvania or Ohio. It may be in Colorado and Texas. The conclusions expressed, however, are applicable to all petroleum fields and are not controverted by the knowledge existent of the other or older districts. It is probable that if the geology of these could be really known the conclusions here stated would be affirmed. In both Pennsylvania and Ohio the petroleum deposits are in long, comparatively narrow lines or bands, which could be sediments laid down in the shallow waters next an old shore line.

In California and the new fields of Texas and Colorado the conclusions have a definite practical value in analyzing unproven ground as to possibilities. In California what is known as the Coast Range was at the beginning of petroleum a chain of islands, a counterpart of the island barrier of southeastern Alaska to-day. Between it and the land now the Sierra Nevada range was a great gulf or sound. Erosion provided the sediments which in time filled the sound and made the Sacramento valley. In the sheltered shallow water bordering the islands and the mainland the marine plant life thrived and its remains mixing with the sediments were the beginning of the petroleum.

JUDGE DIXON, in his decision enjoining the American Smelting & Refining Co. from purchasing the plants of M. Guggenheim & Sons, found that the value of the latter as physical possessions, including the cash to be turned over, did not exceed \$10,000,000, and that about \$23,000,000 of the \$33,000,000 of stock for which they were to be bought was represented by good-will of the business and leases and contracts, the details of which were not disclosed. The consolidation has been made despite the decision, which it seems was anticipated, but the court findings of the actual value of the Guggenheim plants will continue to be advisory information of the best description to intending competitors in the smelting business.

THE Canadian Government has had under consideration the establishment of a mint at Dawson which would make a coinage charge of 5% instead of royalty on gold. The idea was that as the gold was taken in local business transactions at an average of \$1 an ounce less than the coinage value it would go to the mint instead, as the 5% charge would be less than the \$1 discount of the merchants. Had this been done the Government would have gained, as all of the gold mined would be turned in for coinage, and the miner would gain by the difference between the two shaves.

Concentrates.

FIFTY YEARS of gold mining in Australia have produced \$2,170,000,000.

THE first electric railroad was from Port Rush to Giant's Causeway, Ireland.

THE fourth annual session of the International Mining Congress meets at Boise, Idaho, July 21-25.

ALABAMA MINES in 1900 produced 650 tons of bauxite, the aluminum mineral used as the commercial source of that metal.

THE United States District Court in Oregon has decided that miners in that State cannot take timber from public land for mining use.

CRUDE PETROLEUM is measured by barrels of forty-two gallons, equal to 5.6146 cubic feet; refined petroleum by barrels of fifty gallons, equal to 6.6840 cubic feet.

THE Bay Counties Power Co., in suspending their 4400-foot long cable across the Straits of Carquinez, first let it sink to the bottom and then drew it over the towers into place by a steam engine.

NO UNITED STATES law requires the recording of a notice of location of a mining claim except in Alaska. Several of the States and Territories have statutes that require the recording of such notices.

THE Colorado Supreme Court has decided that, though a prospector may believe a lode to exist within a patented placer mining claim, he has not the right to enter on the land for the purpose of exploring to confirm his belief.

IF a piece of steel which has been magnetized be broken into several pieces, each of the pieces will become a magnet. This is true independent of the size of the fragments; pulverized, the separate particles will still remain magnets.

PERCUSSION CAPS are filled with saltpeter and other ingredients. Detonating caps contain from seven to fifteen grains of fulminate of mercury, according to the strength required, and the shell is made five or six times longer than for percussion caps.

GOLD crystallizes in the Isometric system. The form is that of two four-equilateral-sided pyramids set with their bases together. Perfect crystals are rare. They have been found in what are locally known as "seam diggings," in Placer and El Dorado counties, California.

THE deviation of the magnetic needle is influenced by the presence of great masses of certain eruptive rocks, notably basalt, andesite and some serpentines. It has been found that large masses of the first-named can attract the north pole of the needle at a distance as much as 50 miles.

SMALL articles may be coated with silver by first dipping them into a solution of common salt and rubbing with a mixture of one part precipitated chloride of silver, two parts of potassa alum, eight parts common salt and eight parts cream tartar, after which the article being so coated is washed and dried.

WIRE usually shows a slight variation of diameter from exact gauge, being usually a small fraction of an inch larger. The amount is sufficient to be taken into account in some kinds of work. Hammered drill steel shows more variation than that manufactured in the rolls. The variation is as much as a sixteenth of an inch.

IN cyanide practice the surplus solution is usually run off with the spent tailings. There is an unavoidable loss of solution, and at present there is no cheap means of recovering the cyanide from the surplus solution. The potassium cyanide might be precipitated by means of zinc sulphate; but that is believed to be too expensive a process to warrant recommendation.

IT rests with the owner of a mining claim to do the \$100 of assessment work, and against the possible misconduct of an employee in neglecting to do the work, though fully paid to do it, and making affidavit that he had done it, the owner must protect himself by knowing that the \$100 of work was in fact performed. Failing to do this, the claim is open to be located.

A GOOD wiping solder is an alloy of equal parts of tin and lead. Any metallic impurity impairs the quality. Care must be exercised in using it in soldering zinc or galvanized iron. If the zinc gets into the solder it makes the solder spongy and it will not wipe, becomes worthless. The presence of the zinc can be noticed in the crystallization which it forms on the surface of the bar.

CADMIUM is a silvery white metal somewhat harder than tin. Its usual occurrence is as the sulphide, greenockite, associated in small quantities with zinc sulphide, sphalerite. Commercially the supply is obtained incidentally in reducing zinc ores. In smelting them the cadmium distills over first, oxidizes, and forms a brown powder in the receivers. This is mixed with charcoal and distilled, yielding very pure metal.

VERY simple appliances save nearly all the gold in placers exploitable by a working miner. Some loss is inevitable with the first washing, but it is rarely more than 10%. To lose half of the gold it would have to be thrown away. The tailings from hand washed ground may pay for reworking after fully air slacked by handling them in quantity. It is customary in California to sell the tailings from drift mines to Chinese.

BLANKET SLUICES are still used to some extent. The chief advantage is that when set at the proper angle for the ore and frequently cleaned they will save fine amal-

gam. They have been employed to handle the vanner tails, and, as such, save some of the slimes that pass the tables. To use them or not depends simply on two questions: Is the loss past the machines unavoidable, and, if it is, do the blankets save more values than the cost of saving?

THE next meeting of the American Institute of Mining Engineers is to be held at the city of Mexico in November of this year, and part of the programme will be excursions to many interesting points. It is intended to translate the papers read at this meeting and to publish in Spanish and English. The secretary, R. W. Raymond, desires early notice of papers for the meeting and that the manuscript of accepted ones should be delivered to him by July 1st.

IN grinding two metal surfaces so that they will fit true, the surfaces should be run over with by a file to reduce the larger inequalities. Clean the surfaces thoroughly and wipe both clean. For grinding, use fine sand sifted through a screen. Mix with water and apply a small quantity at a time, first to the parts that grind the hardest. Work rapidly, pressing lightly and turning. Apply water and grinding sand till an even surface is obtained; then work with the old sand—that already on—to finish up.

QUICKSILVER which has come in contact with the smallest portion of grease or resin becomes sluggish, and comparatively large grains of gold will float upon its surface without being amalgamated. Its brightness changes to a dull leaden color, and it flows easily. Distillation will not suffice in the case of resin or grease, for both pass over in retorting and condense again. In such a case frequent washing of the mercury in a strong solution of potash overcomes the flouring and sickening of the quicksilver.

THE School of Mines at Columbia University has changed the character of its laboratory instruction for mining engineering and now aims to familiarize the student with the principles of typical processes, and the instruments of precision employed in connection with them, rather than to teach him what can be termed in distinction the manual handling of processes. The students of metallurgical engineering have much more of the latter class of instruction and more specializing. The change recognizes the every-day practical difference of service required of the mining and of the metallurgical engineer.

A STEEL-LINED CHAMBER at the foot of an elevator shaft, built in such dimensions that in the event of the elevator falling it will compress the air in the chamber and break its fall on the air cushion, is used in a number of high office buildings in New York, and has been found on trial to work successfully. The conditions under which a cage is ordinarily used in a mine shaft make a similar device in it impracticable. What is wanted in a mine shaft are means for stopping the fall of a cage before it starts—that is to say, after the hoisting cable has broken, and before the cage has gathered momentum downward.

THE unscreened mixture of sand and gravel just as it is shoveled up from a river bed can frequently be employed for concrete. It has been so used in the construction of a concrete overflow dam and ditch headwork on the North Fork of the American river, near Auburn, Cal. The dam is 300 feet long and 35 feet high in the middle. It was constructed below a timber dam, the latter acting as a coffer dam and remaining in place while the other was under construction. Using the river sand and gravel just as it came, the principal item of cost was the cement. The sand and gravel required no hauling, being taken from the filling of mining tailings behind the timber dam.

THE peak load on an electric motor, used as the measure of electrical power which that motor is supposed to be consuming, is the highest reading shown by the graphic diagram made by the wattmeter. Used in a contract between a consumer of electric power and the company furnishing the power as the basis of the payment to be made, it means that the consumer agrees to pay for the power as if the quantity that he received averaged the highest amount that was taken at any time in the period of the contract. In electric power used for hoisting the variations of load are very considerable, and the peak load shown by the wattmeter is far above the actual average of power consumed. In operating mill machinery the power used is more nearly constant.

THE United States Mint never makes assays of ore for any one. The only assaying done at that institution is of gold dust or bullion to determine its fineness and consequent value. If a miner brings in gold dust or bullion the lot is assayed in order to ascertain its fineness, and he receives returns in accordance with its value. This fineness of the gold is the only thing determined by assay at the Mint, except the value of the silver possibly contained in it, and ore assays are never made. Both the United States Mint and the California State Mining Bureau are occasionally asked to do assay work, which is really the business of private parties. The Mining Bureau will make determinative tests of ores and minerals in a qualitative but not a quantitative way; that is, it will determine the character of a mineral or tell what metals an ore contains. But it will not attempt to ascertain the quantity or value of the contents. To make quantitative assays free would be interfering with the business of private assayers. As miners generally care more to find out the quantity and value their ore contains than its mere constituents, they would better apply

to an assayer in the first place. Certificates of assays of ores represented to have come from either Mint or Bureau are false.

LARGER amounts of mining and milling machinery are being made than formerly, since there are so many more producing mines; but there is not an increase of machinery in proportion to the number of mines being worked. Formerly almost as soon as a ledge was struck, or purchased by men with money, a stamp mill with full equipment was ordered, with the expectation that it would shortly repay the investment. The proper development of the mine was an after consideration. Men now start in with a hand windlass for hoisting. When they get water they start with a common pump. Then horse power is used for a while, followed by a small gasoline engine for hoisting and pumping. When necessity requires a steam engine, hoist and pumps are put in. But all this is done before any attempt is made to get ore reduction machinery. Then when it is finally proved that they have a mine the owners get a mill, concentrator, etc., but usually want the mine to pay for it. There is rarely any attempt to start out with a fully equipped milling plant. Many mines will not warrant a special mill, and custom mills are resorted to for crushing the ore. There are many custom mills in the mountains and hundreds of mines depend upon them entirely; a mine may be worked for years before it is decided to give it a mill of its own.

IT is not deemed well to locate and try to hold several thousand feet of mining ground. A miner who has too much is worse than land poor, because it takes about all his time and money to keep up the annual assessment work required by law. On this plan not one of the claims can be properly developed, and only a little gophering done on all. By concentrating the labor on one, or even two, claims something worth while can be accomplished. Purchasers are shy of prospects which have been held several years by assessment work only, but if they see that a miner has really made an effort to open one it gives an idea of value to the claim, making it more salable. Men sometimes want to take whatever mining ground is in sight, arguing that if 1500 feet on a ledge is good to have 6000 feet is ever so much better. Experience has proved the fallacy of this idea. Fifteen hundred feet is the length of a single lode claim allowed to an individual by the Government, and it is usually as much as one can well handle. It is better to have a real mine on that much ground than a dozen mere locations on four times as much. A piece of mining property moderately well opened is of some value to the owner, whereas a dozen prospects with 10 or 15-foot shafts amount to little. Such locations cannot be sold and they bring no profit to the owner, while requiring certain work each year to retain legal ownership.

NICKEL commercially occurs as a constituent of what is called nickeliferous pyrrhotite, characteristically found in the eruptive rock known as gabbro. In this rock the minerals occur as original constituents of the fluid or semi-fluid rock, collecting in the cooling process in the portions of the mass near contacts. The minerals, where they are in commercial quantities, form ore bodies that are lodes, though they could not be described as ledges. That is, the ore bodies do not have walls, except the contact formation, but the values grade out more or less sharply into the gabbro or its successor, serpentine. The ore usually contains some copper and 2% to 4% of nickel; the latter would constitute a high-grade nickel ore. Cobalt almost invariably accompanies the nickel. The Sudbury, Canada, deposits are the most extensive known and the most cheaply mined. Practically the output of these mines dominates the market and makes the price. Unless the quantity found in a new deposit is considerable, or the nickel is associated with gold, silver or copper so that its recovery is incidental as a by-product, its commercial exploitation should be deliberately considered in advance. Few matting plants are prepared to smelt it in small lots. Where the ore in addition to the nickel carries silver and gold in commercial quantities the smelters who would buy the ores for these metals can probably be induced to pay something for the nickel.

OFTEN a man can tell nearly as well with a hornspoon or pan what amount of free gold there is in the rock about as well as he can by assay. The percentage of sulphurets and their value must be determined by an assay; but for ordinary purposes the horn will show whether there is value enough in the rock to lead a man to continue work on his find. The probable yield, as a rule, can be determined as well in this way as by a fire assay. The latter is often misleading in gold ores, unless exceedingly careful sampling is done. Averaging up a number of assays is not nearly as satisfactory as a number of horn or pan washings, as far as ascertaining value is concerned. A prospector, moreover, cannot well be bothered with packing around an assayer's outfit, as these things are expensive and hard to take care of. Of course, if a man is settled down in some camp, it is well to have these appliances and to understand how to use them. Assayers are to be found throughout the mountains, even in out-of-the-way places, and their charges are reasonable. In a silver, copper or lead country a few qualitative tests are easily learned, and, with some experience, a good guess may be made of quantity in the ore, enough at least for the prospector's purposes. For blowpipe work considerable skill is required, and few do assaying with that implement. In a gold country it is a waste of time for a man going prospecting to undertake to learn assaying.

The Granite-Bimetallic Con. M. Co.'s Mill.*

Written for the MINING AND SCIENTIFIC PRESS by A. D. MOFFAT.

This mill is located in Granite county, near the town of Philipsburg, Mont., and about 3 miles east of the great bonanzas, the Granite and Bimetallic mines—the Granite with a record of \$12,140,000 and the Bimetallic with over \$1,630,000 in dividends, a total of \$13,770,000.

The ore is delivered to the mill from the mine by a Bleichert aerial tramway, and the coal used at the mines for steaming purposes is forwarded on the up-going buckets; so that the cost of handling the ore and coal is nominal. The tram buckets hold 500 pounds of ore, and they are loaded on the return with 250 pounds of coal. At the terminals of the tramway the ore is discharged into bins, where the salt is mixed with the ore for chloridizing or converting the sulphurets of silver to a chloride of silver. The elevation of the ore house is sufficient to feed the ore direct by automatic feeders from the ore chute into four rotary drying cylinders. These drying cylinders are so arranged that the ore discharges into four large hoppers, which hold from twelve to fifteen tons; these hoppers are located back of the battery, where the dry ore is drawn from them, weighed and distributed into the battery hoppers.

The battery consists of 100 stamps of 1000 pounds each, dropping 8 inches, 100 drops per minute, and crushing, through a 20-mesh screen, 2.1 tons to the head every twenty-four hours.

To the practical man this tonnage will seem high, as it has always been considered good crushing at 1.125 tons to the stamp where the ore and salt were mixed together. If we were crushing the salt in a separate battery, as most mills are, our tonnage would be greatly increased. It is well known that after salt passes through the driers it absorbs moisture and gums the screen, retarding a free discharge from the battery. It will readily be seen that the ore from these mines is not hard to crush. The ore is a sulphuret and has no free chlorides in it. There is some native silver, for, while the chlorinations run from 83% to 85%, the extractions are 90%.

There have been two Stetefeldt chloridizing furnaces constructed in the mill this year of greater capacity than any heretofore built. Each will successfully chloridize from 100 to 110 tons of ore per twenty-four hours.

The mill is arranged in two parts. The No. 1 furnace is 51 feet 4 inches high from the drawing floor to the top of the furnace, or main shaft. There are five hoppers—one in the main shaft, one in the return flue and three in the telescope.

There are sixteen dust chambers, 3:4x9 feet, and 3:4x6 feet openings. No. 2 furnace is 51 feet 4 inches high, with four hoppers, stack one return and two in telescope, with twelve dust chambers, each 4x10 feet, and 4x6 feet openings.

There are two cooling floors, each 25x275 feet, with a capacity of 500 tons roasted ore. The drawing floor is 8 feet higher than the cooling floor, being 13x275 feet. It will be readily seen that this cooling floor capacity gives ample time to perfect the chlorinations before going to the pans for treatment.

The pan room, or amalgamating department, is 308 feet long, having forty-two pans, twenty-one settlers and two clean-up pans. This department is in front, parallels the batteries, and is situated between the cooling floors. There have been added to the mill this year three 9-foot water-seal gas producers, which furnish the gas for drying and chloridizing the ore. These producers consume fifteen tons of coal per twenty-four hours in drying and chloridizing 220 tons.

On Aug. 9th we discontinued the use of steam in operating the mill. The engine used up to this time to furnish the power was a Fraser & Chalmers cross-compound condensing 500 H. P. The present power is electricity and is furnished by the Montana Water & Electric P. & M. Co. The water for driving the generators at the power house is brought from Flint creek and is conducted to the power plant through a plank flume 7500 feet long, and has a carrying capacity of 2000 cubic feet flow per minute, discharging into a head box. From this box a 36-inch diameter steel pipe, 1500 feet long, with a fall of 690 feet, carries the water to the receivers at the power house. The receiver is built to supply four water wheels. The power house is 100x30x40 feet. It is located 9 miles from Philipsburg.

The generating units installed consists of two 550 kilowatt (or 737 H. P.) Westinghouse three-phase alternators, generating at 440 volts, and direct-connected to two 900 H. P. Pelton wheels. The governing of these wheels is controlled by an electric governor. In addition, there are two 125-volt, compound-wound exciters of 22½ kilowatts (30 H. P.), each direct-connected to two 50 H. P. Pelton wheels. Each of these machines has a capacity for the field excitation of both alternators.

The real energy of the circuit is shown by a poly-phase integrating wattmeter. The transformer equipments consist of four 200-kilowatt raising trans-

formers with 440 volts primary and 16,000 volts secondary at the power house and four 150-kilowatt lowering transformers, 15,000 volts primary and 440 volts secondary at the mill, a transformer being held in reserve at either end of the line. The transmission line is 6½ miles in length and is set with the best cedar poles and strung with four No. 6 gauge copper wires, three of them being used for carrying the current, and two transpositions being made to counteract the effects of mutual induction.

The line is protected at each end by the lightning arresters. The motor equipment in the mill consists of two 100 H. P. 400-volt Tesla motors, operating the pans and settlers; two 100 H. P. 400 volts and one 50 H. P. 400 volts operating the batteries; two 20 H. P. 400 volts operating the elevators, fans, bolters and furnace feeders; one 30 H. P. 400 volts operating the driers, and one 10 H. P. 400 volts operating the coal and salt elevators.

It will be readily understood that the number of motors and the way they are placed in the mill greatly expedites matters in stopping and starting any part of the plant. Formerly, if a rivet came out of the main belt it meant, at least, an hour of lost time, as they would have to hang up a hundred stamps, drop the pan mullers and stop the engine, in order that the repair gang could replace the rivet in the belt. That hour of lost time meant tons of ore not crushed.

Credit is due Paul A. Fusz, president of the Granite-Bimetallic Co., for the pluck, energy and perseverance he has displayed in remodeling this mill and installing the electric power plant.

The entire plant is full of interest to the practical man, and a trip of inspection through it will convince him that this company has a "modern and up-to-date plant."

Efficiency of Rock Drills.

Let me know upon what is based the efficiency of rock drills. Has there been any method devised for testing the force of the blow, the pull and the twisting moment? Berkeley, Cal. T. G. S.

In response to the above, an expert on the subject says:

I am not aware of any systematic tests performed to precisely determine the exact strength of the blow, the back pull and the twisting moment. In fact, I do not believe that deep scientific research in this direction would be justified, or rather would lead to anything like absolute and useful rules, for the following reasons:

A rock drill—I mean the most common variety, i. e., the percussion rock drill driven by compressed air—is essentially and admittedly a machine of low mechanical efficiency, if this term implies that the amount of work done by the compressed air in the cylinder of the rock drill is only a small percentage of the work expended in operating the compressor.

Experience shows that a successful rock drill must fulfill a number of requisites, among which the mechanical efficiency is not by any means the most important. The methods which would naturally suggest themselves to improve this efficiency would, at the same time, make the machine unpractical, and the best that can be done in this direction is apparently to eliminate all hindrances to the delivery of the blow from the piston to the rock, i. e., to avoid cushioning on the fore end of the piston, and to maintain the full pressure of air on its back end as long as practicable. Quick action is also a desirable feature, and means wide and short passages between the valve chest and the cylinder at a possible increase in the air consumption of the machine.

But while these requirements may be said to always exist, they must be satisfied to various degrees, according to the nature of the ground. The true value of a rock drill is ultimately gauged at its capacity for making a rapid advance in a given sort of ground, and this involves not only the percussive power of the machine, but also its adaptation to mudding, i. e., to keeping the hole free from obstructions.

The result is that an efficient machine, i. e., one designed to deliver a powerful blow on hard rock, may not do comparatively as good work in soft or seamy ground, while a test of its percussive capacity would have led to declare it efficient.

The pull and the twisting moment can be estimated from the air pressure, the size of the piston and the pitch of the rifle bar, but the result of this computation may be of little use to determine the actual working value of a rock drill.

In my opinion, precise methods of investigation, which have been so fruitful of valuable results in the case of steam and internal combustion engines, would not be warranted in the case of rock drills.

NEW YORK CAPITALISTS are said to be considering a proposition to utilize the Colorado river in Arizona and California to develop electric power. It is claimed that many times the quantity developed at Niagara can be readily had.

THE Montana Supreme Court has decided that the Legislature exceeded its constitutional powers in changing the name of Deer Lodge county, in which Anaconda is situated, to Daly county. The old name is restored.

Exporting Machinery.

TO THE EDITOR:—Shippers of mining apparatus to Japan often wonder why the machinery has failed to give the same good results obtained in America. I have lately visited the coal and other mines of Japan and found some reasons for the poor work of imported mechanical devices. In the first place the mining machinery which is exported to Japan is not always properly boxed. It must be remembered that while the steamers are en route on the ocean even the boxed parts of delicate mechanical devices may become broken. It is not unusual to have several pieces in a case break while in transit, and it is always difficult to replace those parts. Figure 1 shows the patched blades of a fan wheel for ventilating purposes which arrived here from a foreign point recently. One blade was snapped off at B and the repair had to be made in the manner shown. Again the blade A was fractured, and had to be patched with strips of sheet metal. These pieces caused the wheel to be unbalanced and it ran in a wobbly condition, which was rectified in part by weighting up the other blades. But it is not always bad packing that cause the breakages and poor adjustments of mining machinery in Japanese mines. I saw a crushing machine, in which one of the main shafts carrying a beveled gear was so far out of line with the meshing gear as to cause the two gears to operate with an interval as at C, Fig. 2, causing the cogs to miss and strip. The Japanese mining engineers and machinists are, as a rule, industrious and capable, but they fail to appreciate the necessity of correct setting of parts of machinery with which they are not perfectly familiar. There is not an abundance of machinery in the Japanese mines, but I visited those near Nagasaki which supply coal to the shipping and found quite a good proportion of modern mining mechanical devices. In one mine they

had some machinery running with ball bearings in the journals. It is a mistake to send machinery here with these ball bearings, especially for the mines, because the Japanese machinists are not familiar with their use. I saw a number of ball bearings clogged with coal dust and the balls sliding. In one journal the conditions were as at D in Fig. 5. The cone had become flattened at one side

through wear and the steel balls lodged, causing friction and bad service. Plain bearings are the best for mining machinery for this country. In another case I found that the line of balls were set so as to ride on the point of the cup, like F, Fig. 4, instead of E, as should be. This trouble was overcome by setting the cone in the right position, but often the mining engineers do not take the trouble to do this and they let the thing run until too late. The first thing you know a complete new journal is needed. Complicated machinery is not the only difficulty with which the Japanese mining engineers have to contend. They often receive outfits of piping for water, steam or oils which have to be overhauled. For example, in one mine the pipe fitters are required to put an air bell or dome in a pipe, A, Fig. 5, and they chose the point at B. This caused the pipe to choke frequently and there was much trouble with it until the dome was removed and placed upon one of the horizontal lines of the main, instead of in the drop.

Power and transmission machinery is being put into many of the mines of Japan. In Fig. 6 is one way in which I saw a rope drive installed. The main driver is the belt wheel C. A rope drops from a grooved pulley on the same shaft to D, thence to E, going up to F, thus transmitting the power from one shaft to the other and causing the second shaft to revolve in a direction opposite to that of the first. The trouble was that in the short connection to D the rope kept slipping and wearing, as no effective grip could be secured. This trouble was finally done away with by increasing the distance from one to the other. I saw a number of rope drives arranged like that in Fig. 7, showing that the Japanese engineers lack judgment as to the capabilities of a rope drive. The crossing at G is so short that the rope cannot run well. Unless very tight it would slip. This defect was also overcome by putting the wheels about 12 feet apart. There is a very excellent field in Japan for the sale of mining machinery and power and transmission machinery for mines. Conveying machinery, mining pumps, elevating devices, mining tools and belting are all in demand and good prices are being obtained from sales. There are a few agencies in such places as Nagasaki, but lines of machinery and mining supplies carried in stock are very limited, so that many of the Japanese mining engineers try to get along with homemade apparatus. I have seen Japan made power generating devices from overshot water wheels to steam power contrivances. I saw one steam wheel affair in which powerful jets of steam were discharged against a propeller arrangement so as to produce good and steady power, but the wastage of steam was enormous.
